About the Author

Dr. Greta Noordenbos is a senior researcher in the Department of Clinical Psychology, Leiden University, the Netherlands. She completed her doctoral thesis on cultural and gender factors in the development of anorexia nervosa in 1987. She then conducted research on several topics in the field of eating disorders: risk factors and prevention, long-lasting and chronic patients, criteria for recovery, quality of treatment, emotion regulation and alexithymia, inner criticism and self-esteem. In 1994, she founded the Dutch Committee for Prevention of Eating Disorders and participated in the Specialized Interest Group for Prevention of the Academy of Eating Disorders. She has written several books and articles on eating disorders. Together with Professor Walter Vandereycken from Leuven University in Belgium, she edited the Dutch version of the *Handbook of Eating Disorders*. She was also a member of the Task Group of the Dutch Guidelines for Eating Disorders and became an honorary member of the Dutch Academy of Eating Disorders in 2010.

Address for correspondence: Dr. Greta Noordenbos: Department of Clinical Psychology, Leiden University. Wassenaarseweg 52 2333 AK, Leiden, The Netherlands. Noordenbos@FSW.Leidenuniv.nl

Foreword

This book describes in a unique way the conditions necessary to recover from an eating disorder. Greta Noordenbos is one of the few experts in this field who has done research into these aspects. This book reflects the knowledge and insights she developed about the recovery process of eating disorder patients. What makes this book unique is that she writes from the perspective of the patients and the way they think and feel. The stories of many such patients are given in detail here. The author makes very clear how important it is to listen to eating disorder patients carefully and with respect, and try to understand what is going on in their minds.

The information provided in this book will be very useful not only for patients, but also for their families and the therapists involved in the process of recovery from the eating disorder. It becomes clear that recovery is much more than ensuring enough food intake, weight recovery and reducing binging and purging. Although they are necessary conditions for recovery, it is also important that eating disorder patients gain insight into their own feelings, needs and wishes and learn to express their emotions. They also have to improve their body image and develop more self-esteem and empower their identity. Moreover, they have to improve emotion regulation and social relationships. Many quotations from former patients illustrate which factors helped them to recover. This book will certainly motivate eating disorder patients to ask for help and so take the first steps towards recovery. For that reason, I would advise every patient, parent and therapist to read this book.

Dr. Johan Vanderlinden

Psychologist-psychotherapist University Psychiatric Centre of Catholic University in Leuven, Psychological Faculty of Leuven University, Belgium

Acknowledgements

I would first like to thank all the eating disorder patients I interviewed. This book could not have been written without their inputs about their process of recovery. They inspired me to write this book, because they are the best guides to inform clinicians, professionals, parents and friends what it means to develop an eating disorder and to recover from it. They have shown that full recovery is indeed possible. Recovered patients are also important role models for all those who continue to suffer from eating disorders.

The first edition of this book, entitled *Gids voor herstel van Eetstoornissen*, was published in 2007 in the Netherlands by De Tijdstroom, Utrecht. Many readers stimulated me to publish an English version of this book. I would like to thank Joanna Kortink, Liesbeth Libbers, Carmen Netten, Ellen Spanjers, Johan Vanderlinden and many other professionals for their support and De Tijdstroom for their permission to publish an English version of this book.

The English version, entitled *Recovery from Eating Disorders: A Guide for Clinicians and Their Clients*, has been completely rewritten and updated with new assignments and questionnaires. I am very grateful for all the useful comments of my international colleagues to improve this book: Tabita Björk, Runi Börreson and Rachel Bryant-Waugh. Darren Reed was very helpful in getting this book published. Many thanks also to Ineke Smit who carefully corrected my English. Without their support and valuable suggestions, I would never have been able to publish this book.

Introduction

Can eating disorder patients recover? What changes should they make in order to recover? For a long time, the most important goals for recovery were normalizing their eating habits and weight. Although these goals are necessary steps in the process of recovery, they are not enough. Eating disorder patients struggle not only with food and weight, but also with very negative thoughts about their bodies and themselves. They are often very critical about themselves, and if they are not able to cope with their own high standards, they think they have failed and blame themselves. They also have problems with emotion regulation and social relationships. In order to recover from their eating disorder, they have to change many aspects of their lives: not only their eating habits and weight, but also their self-evaluation and body attitude, their feelings and emotions, and their relations with others.

To find out what changes are necessary for eating disorder patients in order to regain full health, I interviewed nearly a hundred former female and male patients about their process of recovery. They talked about the difficult period before their eating disorder and the first stage of their dieting regime, which was often felt as a *solution* to their problems. The positive feelings in this first stage of the eating disorder encouraged them to continue their dieting behaviour. However, the longer they continued dieting, the more severe were the negative physical, psychological and social consequences, which made their lives very difficult and lonely. Confronted with all these negative consequences, they slowly realized that they had to change their eating habits in order to recover.

2 Recovery from Eating Disorders

Although the first steps on the path to recovery were very difficult, they finally succeeded to eat in a healthy way and to enjoy food. They developed a positive attitude towards their body, had better self-esteem, and were able to express their emotions and have a worthwhile social life. They were very proud of having overcome their eating disorder. This is very clear from what Caroline says:

Each new day I am so glad to be alive and I really enjoy my life. It is a great pleasure to go to work, and to feel the wind in my hair when I walk or bike. I have much more energy and enjoy each ray of sunshine on my skin. I now see food as a rich source of energy and I really like it, instead of being scared of it. I am also grateful to my lovely friends and parents. The way to recovery was not easy and sometimes I almost lost the courage to continue, but the reward is very high. I really hope that all people who struggle with an eating disorder are able to recover, because they have so much to gain.

The experiences of recovered patients offer much hope, as they show that full recovery is possible. Their stories make clear that the process of recovery is not easy, but the result is worthwhile. This should inspire people who continue to struggle with eating disorders and therapists who try to help them recover.

When have Eating Disorder Patients Recovered?

In the literature on recovery from eating disorders, it is difficult to find a clear definition of recovery (Noordenbos, 2011). For a long time, the criteria for recovery from an eating disorder were restricted to the reduction of symptoms, such as disturbed eating habits and weight. However, even when these symptoms have alleviated, the underlying factors remain. As long as these factors are not addressed, the risk of relapse is quite high. Strober, Freeman, and Morrell (1997) evaluate the reduction of symptoms as partial recovery. For *full recovery* from an eating disorder, not only should the symptoms be reduced, but the underlying factors which have contributed to the development of the eating disorder should also be alleviated. Full recovery implies eating the right amount of food and maintaining a healthy weight, having a positive body attitude, increased self-esteem, and better emotional and social coping strategies (Björk & Ahlström, 2008; Deter, 1992; Noordenbos, 2011; Noordenbos & Seubring, 2006; Pettersen & Rosenvinge, 2002). Moreover, co-morbidity also needs to be reduced, such as alcohol abuse, depression, fear disorders, personality disorders, and so on (Steinhausen, 2002).

Research shows that most patients can recover quite well from their eating disorder, and full recovery is possible for many patients. In general, 50% of the patients with anorexia and bulimia nervosa recover, 30%

improve and 20% stay ill (Steinhausen, 1999, 2002). The percentage of patients who recover from bulimia is somewhat higher and those who recover from binge eating disorder is even more so. Recently, the percentage of patients who have recovered has increased because of earlier diagnosis and better treatment. In case of adolescents, eating disorder recovery percentages are as high as 85% (Nilsson & Hagglöf, 2006).

Can All Patients Recover from their Eating Disorder?

Unfortunately, not all patients can recover from their eating disorder. Factors that severely hamper their recovery are a late diagnosis, patient's and doctor's delay, late and inadequate treatment which focuses only on partial recovery such as food and weight increase, combined with a lack of attention to the reduction of the underlying factors, lack of aftercare and no strategies to prevent relapses. The longer patients have had an eating disorder, the more difficult it is to change their eating habits and to reduce the physical, psychological and social consequences. When treatment is not adequate and effective, patients lose their hope of improvement and recovery (Noordenbos, Oldenhave, Muschter, & Terpstra, 2002). However, this book shows that even after many years of having had an eating disorder, patients were able to improve the quality of their lives and some were able to recover.

Recovered Patients as Guides and Role Models

In this book, many former patients talk about the process of recovering from their eating disorder. Although most of the patients quoted are female, there are also some male patients who tell us about their recovery process. To preserve patients' privacy, their names have been changed.

All recovered patients sooner or later found a way out of the prison of their disorder. They talk about the stages they have gone through and all the adjustments they had to make in order to recover. They also tell us about the problems, traps and pitfalls they had to overcome and how they survived. Their stories are the best evidence that it is possible to recover from an eating disorder. Recovered patients, whether female or male, are therefore role models for all those who continue to struggle with their eating disorder.

Content of the Book

This book begins by describing the most important stages in the development of eating disorders, from problems and risk factors in the period before the

actual start of the eating disorder (Chapter 1) to the first stage of dieting and slimming, which is often experienced as very positive (Chapter 2). However, patients are soon confronted with all kinds of negative psychological, physical and social consequences, which are described in Chapter 3. When the negative consequences become very severe and dominate patients' lives, they reach a turning point after which they feel motivated to recover, as described in Chapter 4.

The process of changing eating habits and overcoming the fear of a healthy diet is described in Chapter 5, and the development of a more positive body attitude is dealt with in Chapter 6. In Chapter 7, the process of recovering from all negative physical consequences is described, while Chapter 8 deals with the development of self-esteem and a more positive self-evaluation. Chapter 9 focuses on how patients learn to express their emotions and feelings. Chapter 10 deals with how patients developed better social relations. In Chapter 11, the most relevant questions about recovery are answered. In the final chapter, Chapter 12, a checklist for all relevant aspects of recovery is presented.

A Book for Both Clinicians and Clients

This book is important for all therapists and professionals who work with eating disorder patients. It offers them a clear insight into the changes which are necessary in order to recover from an eating disorder, such as normalizing eating habits and weight, increasing self-esteem and body attitude, and learning to express emotions and develop better social relations.

This book will be very useful for all those who struggle with an eating disorder, whether they be female or male, have just been afflicted by their eating disorder, or have already had an eating disorder for many years. They can be motivated to change when they read the stories of former patients who succeeded in recovering from their eating disorder. Recovered patients are the best guides to show the way out of the prison of the disorder. Eating disorder patients will find many assignments and questionnaires in this book which can help them overcome their eating disorder.

This book will also be very informative for parents and friends, who may learn from it not only why this disorder is so difficult to overcome, but also that full recovery is possible.

How Therapists and other Professionals may Use this Book

Therapists and other professionals who work with eating disorder patients can use this book as a guide to help their patients in the recovery process. You can follow this book together with your clients. You can ask them to
