<b>INTRODUCTION</b>	1
About This Book	1
Foolish Assumptions	2
Icons Used in This Book	2
Where to Go from Here	3
 <b>PART 1: BASIC TRAINING</b>	 5
<b>CHAPTER 1: Access 2019 Basic Training</b>	7
What Is Access Good For, Anyway?	8
Building big databases	8
Creating databases with multiple tables	9
Databases with user forms	12
Databases that require special reporting	13
What's New in Access 2019?	16
Reach Out with SharePoint	17
How Access Works and How You Work with It	18
Opening Access	18
Selecting a starting point	19
Now What?	23
 <b>CHAPTER 2: Navigating the Access Workspace</b>	 25
Diving Right In	27
Working with Onscreen Tools in Access	29
Clicking tabs	30
Using buttons	31
The File tab and Quick Access tools	31
Accessing panes, panels, and context-sensitive tools	33
Customizing the Access Workspace	34
Repositioning the Quick Access Toolbar	34
Adding buttons to the Quick Access Toolbar	35
Removing buttons from the Quick Access Toolbar	37
Minimizing the Ribbon	37
Working with ScreenTips	38
Mousing Around	41
Navigating Access with the Alt Key	41
 <b>CHAPTER 3: Database Basics</b>	 43
Database Lingo	43
Data, no matter how you pronounce it	44
Fields of dreams (or data)	44

Records . . . . .	45
Tables . . . . .	45
The database . . . . .	45
Field Types and Uses. . . . .	46
Choosing Between Flat and Relational Databases . . . . .	51
Isolationist tables. . . . .	51
Tables that mix and mingle . . . . .	52
Building a Database . . . . .	53
Adding and Removing Tables . . . . .	57
One more, please . . . . .	57
Oops, I didn't mean to do that. . . . .	59
<b>PART 2: GETTING IT ALL ON THE TABLE . . . . .</b>	<b>61</b>
<b>CHAPTER 4: Sounds Like a Plan. . . . .</b>	<b>63</b>
Planning Your Database Tables. . . . .	63
Reviewing fields . . . . .	64
Determining data types . . . . .	64
The new normal. . . . .	66
Understanding normal forms . . . . .	66
Normalizing your tables . . . . .	67
Building Tables in Design View . . . . .	70
Creating fields . . . . .	70
Setting data types . . . . .	72
<b>CHAPTER 5: Table Tune Ups. . . . .</b>	<b>75</b>
The Primary Key to Success . . . . .	76
The lowdown on primary keys . . . . .	76
Creating a primary key . . . . .	77
Making Tables Get Along . . . . .	79
Rules of relationships . . . . .	79
Relationship types . . . . .	80
Building Table Relationships . . . . .	82
The Relationships window . . . . .	82
Table relationships . . . . .	83
Indexing for Faster Queries . . . . .	87
Creating your own index . . . . .	88
Adding and removing indexes. . . . .	91
<b>CHAPTER 6: Remodeling Your Data. . . . .</b>	<b>93</b>
Opening a Table for Editing . . . . .	94
Inserting Records and Fields . . . . .	97
Adding a record . . . . .	97
Inserting a field . . . . .	98
Deleting a field. . . . .	101

Modifying Field Content .....	102
Name-Calling .....	103
Renaming fields .....	104
Renaming a table .....	106
Turn Uh-Oh! into Yee-Hah! .....	108
<b>CHAPTER 7: Types, Masks, and Triggers .....</b>	<b>109</b>
Access Table Settings .....	110
Field Data Formats .....	112
Text fields .....	113
Number and currency fields .....	115

You really need to put a mask on those fields .....	121
To require or not to require .....	128
Making your data toe the line with validation .....	129
Give Your Fingers a Mini Vacation by Default .....	131
<b>PART 3: DATA MANAGEMENT MANIA.....</b>	<b>133</b>
<b>CHAPTER 8: A Form for All Reasons.....</b>	<b>135</b>
Generating Forms .....	135
Keeping it simple: Form tools .....	137
Granting most wishes: The Form Wizard .....	139
Customizing Form Parts .....	143
Taking the Layout view .....	143
The theme's the thing .....	145
Managing form controls .....	145
Managing Data in Form View .....	150
Navigating and finding records .....	150
Saving, clearing, and deleting .....	151
<b>CHAPTER 9: Importing and Exporting Data .....</b>	<b>153</b>
Retrieving Data from Other Sources .....	154
Translating data formats .....	154
Importing and linking .....	157
Hit the Road, Data .....	162
Export formats .....	162
Exporting table or query data .....	163
Exporting a report to PDF .....	165
<b>CHAPTER 10: Automatically Editing Data .....</b>	<b>167</b>
Please Read This First! .....	167
Creating Consistent Corrections .....	170

Using Queries to Automate the Editing Process . . . . .	173
Looking for duplicate records . . . . .	173
Running the Find Duplicates Query Wizard . . . . .	174
<b>CHAPTER 11: Access and the Web . . . . .</b>	<b>179</b>
How Access Works with the Web . . . . .	179
Understanding Office 365 . . . . .	180
Connect Office 365 to Access 2019 . . . . .	181
Your data and the cloud . . . . .	182
Upload your Access desktop data to the cloud . . . . .	183
Click! Using Hyperlinks in your desktop Access database . . . . .	186
Adding a Hyperlink field to your desktop database table . . . . .	187
Fine-tuning your hyperlinks . . . . .	188
Testing links . . . . .	190
<b>PART 4: THE POWER OF QUESTIONS . . . . .</b>	<b>191</b>
<b>CHAPTER 12: Finding, Filtering, and Sorting</b>	
<b>Your Data — Fast . . . . .</b>	<b>193</b>
Using the Find Command . . . . .	194
Finding anything fast . . . . .	194
Shifting Find into high gear . . . . .	196
Sorting Alphabetically and Numerically . . . . .	199
Sorting by a single field . . . . .	199
Sorting on more than one field . . . . .	200
Fast and Furious Filtering . . . . .	201
Filtering by a field's content . . . . .	202
Filter by selection . . . . .	203
Filter by Form . . . . .	204
Unfiltering Filter by Form . . . . .	207
Filter by excluding selection . . . . .	207
<b>CHAPTER 13: I Was Just Asking . . . for Answers . . . . .</b>	<b>209</b>
Simple (Yet Potent) Filter and Sort Tools . . . . .	210
Filter things first . . . . .	210
Fact-finding with fun, fast filtering . . . . .	213
Here's the "advanced" part . . . . .	214
Select Queries . . . . .	220
Solid relationships are the key to getting it all	
(from your tables) . . . . .	221
Running the Query Wizard . . . . .	221
Getting Your Feet Wet with Ad Hoc Queries . . . . .	227
Adding the finishing touches . . . . .	230
Saving the query . . . . .	231
Running your query . . . . .	233

<b>CHAPTER 14: I Want These AND Those OR Them</b>	235
Working with AND and/or OR	236
Data from here to there	237
Using multiple levels of AND	238
Establishing criteria with OR	239
Combining AND with OR and OR with AND	240
<b>CHAPTER 15: Number Crunching with the Total Row</b>	243
Say Hello to the Total Row	243
Adding the Total Row to Your Queries	245
Working Out the Total Row	246
Putting it together with Group By	247
Well, that certainly sums it up	248
Counting, the easy way	250
Narrowing the results with Where	251
Creating Your Own Top-Ten List	252
Choosing the Right Field for the Summary Instruction	254
<b>CHAPTER 16: Express Yourself with Formulas</b>	255
A Simple Calculation	256
Complex Calculations	258
Calculate 'til you drop!	259
Using one calculation in another	259
Using parameter queries to ask for help	261
"Adding" words with text formulas	262
Hooray for Expression Builder	264
<b>CHAPTER 17: Take Charge with Action Queries</b>	269
Easy Update	270
Add Records in a Flash	274
Quick Cleanup	277
<b>PART 5: SIMPLE AND SNAZZY REPORTING</b>	281
<b>CHAPTER 18: Fast and Furious Automatic Reporting</b>	283
Quick and Not-So-Dirty Automatic Reporting	284
Creating a quick, one-table report	285
Starting the Report Wizard	289
Previewing Your Report	294
Zooming in and out and all around	295
Pop goes the menu	297
Beauty Is Only Skin (Report) Deep	298
The Print Options tab	298
The Page tab	300
The Columns tab	301

<b>CHAPTER 19: Professionally Designed Reports Made Easy</b>	303
Report Repairs	304
Report Organization	305
Structural devices	306
Page breaks	308
Formatting Stuff	310
Adding color	313
Relocation, relocation, relocation	314
One size does not fit all	316

Use Understandable Names to Keep Things Simple . . . . .	377
Delete with Great Caution . . . . .	377
Backup, Backup, Backup. . . . .	377
Think, Think, and Think Again . . . . .	378
Get Organized and Stay Organized. . . . .	378
There's No Shame in Asking for Help . . . . .	379
<b>APPENDIX A: Getting Help . . . . .</b>	<b>381</b>
<b>INDEX . . . . .</b>	<b>383</b>

# Introduction

---

**W**elcome! Thank you for selecting this book. We assume you've done so because you're hoping it will explain how to use Microsoft Access 2019, and of course, as the authors, we believe this was a wise decision. We, the authors, base this belief on the fact that both of us have been teaching and using Access for a very long time, and we know how to share what we know with our students.

So what was it that made you seek out a book on Access? It might be that you've been asked to use it at work, or perhaps you run your own business or are managing a nonprofit organization. If any of these is the case — or if you're just a regular human with a lot of personal contacts and irons in the fire, you need Access to organize your data. You need it so you can find a name or a transaction in seconds after a few keystrokes, not after minutes spent leafing through your files or swiping apps this way and that on your smartphone. You need it so you can produce reports that make you look like the genius you are. You need it so you can create cool forms that will help your staff enter all the data you've got stacked on their desks — and in a way that lets you know the data was entered properly so that it's accurate and useful. You need Access so you can find little bits of data out of the huge pool of information you need to store. So that's it. You just need it.

## About This Book

---

With all the power that Access has (and that it therefore gives you), there comes a small price: complexity. Access isn't one of those applications you can just sit down and use “right out of the box.” It's not scarily difficult or anything, but there's a lot going on — and you need some guidance, some help, and some direction to really use it and make it bend to your will. And that's where this book — a “reference for the rest of us” — comes in.

So you've picked up this book. Hang on to it. Clutch it to your chest and run gleefully from the store or click the Add to Shopping Cart button and sit back with an expression of satisfaction and accomplishment on your face, because you've done a smart thing (if we don't say so ourselves). When you get home, or when the book arrives in person (or when you download it to your handheld device), start

reading — whether you begin with Chapter 1 or whether you dive in and start with a particular feature or area of interest that's been giving you fits. Just read, and then go put Access to work for you.

## Foolish Assumptions

You need to know only a few things about your computer and Windows to get the most out of *Access 2019 For Dummies*. In the following pages, we presume that you:

- » Know the basics of Windows 10 — how to open programs, save your files, create folders, find your files after you've saved them, print, and do basic stuff like that.
- » Have some goals that Access will help you reach. You
  - want to build your own databases
  - and/or
  - want to work with databases that other people have created
- » Want to use and create queries, reports, and an occasional form
- » Have Windows 10

TECHNICAL  
STUFF

If your computer uses a version of Windows prior to Windows 10, you can't run Access 2019.

## Icons Used in This Book

When something in this book is particularly valuable, we go out of our way to make sure that it stands out. We use these cool icons to mark text that (for one reason or another) *really* needs your attention. Here's a quick preview of the ones waiting for you in this book and what they mean.

TIP

Tips are incredibly helpful words of wisdom that promise to save you time, energy, and the embarrassment of being caught swearing out loud while you think you're alone. Whenever you see a Tip, take a second to check it out.

REMEMBER

Some things are too important to forget, so the Remember icon points them out. These items are critical steps in a process — points that you don't want to miss.

TECHNICAL  
STUFF

Sometimes we give in to the techno-geek lurking inside us and slip some technical babble into the book. The Technical Stuff icon protects you from obscure details by making them easy to avoid. On the other hand, you may find them interesting. (Your inner techno-geek will rejoice.)

WARNING

The Warning icon says it all: *Skipping this information may be hazardous to your data's health.* Pay attention to these icons and follow their instructions to keep your databases happy and intact.

In addition to the content in this book, you'll find some extra content available at the [www.dummies.com](http://www.dummies.com) website:

- » The Cheat Sheet for this book at [www.dummies.com/cheatsheet/access2019](http://www.dummies.com/cheatsheet/access2019).
- » Download files for this book: Want to explore the database used in the book or practice importing and updating data? Simply go to [www.dummies.com/go/access2019](http://www.dummies.com/go/access2019). Here you will find sample files used in Chapters 9 and 17 as well as the Lancaster Food Pantry Access database used throughout the book.
- » Updates to this book, if any, at [www.dummies.com/go/access2019fd](http://www.dummies.com/go/access2019fd).

## Where to Go from Here

Now nothing's left to hold you back from the thrills, chills, and power of Access. Hold on tight to your copy of *Access 2019 For Dummies* and leap into Access. Not sure where to start? See if you spot yourself in these scenarios:

- » If you're brand new to the program and don't know which way to turn, start with the general overview in Chapter 1.
- » If you're about to design a database, we salute you — and recommend flipping through Chapter 4 for some helpful design and development tips.
- » Looking for something specific? Try the Table of Contents or the index.

# Chapter 1

# Access 2019 Basic Training

**A**ccess 2019, the latest version of the Microsoft Office database application, has always been a powerful program, and this version is no different. Chances are, you're reading this book because all that power makes Access an application that's not so easy to learn on your own. If you're hoping to unleash that power for your data, you'll need us. So, good decision to buy this book!

Now, all that power and the need for our book aside, with the very basic parts of Access, the basic functionality that you'll discover in this book, you'll be able to put Access through many of its most important paces, yet you'll be working with wizards and other onscreen tools that keep you at a comfortable arm's distance from the software's inner workings, the things that programmers and serious developers play with. There. Don't you feel better now?

REMEMBER

You don't have to use every feature and tool and push the edges of the Access envelope. In fact, you can use very little of everything Access has to offer and still create quite a significant solution to your needs for storing and accessing data — all because Access can really “do it all” — enabling you to set up a database quickly, build records into that database, and then use that data in several useful ways. Later on, who knows? You may become an Access guru.

In this chapter, you'll discover what Access does best (and when you might want to use another tool instead), and you'll get a look at what's new and improved in Access 2019 (compared to Access 2016). You'll see how it does what it does, and hopefully you'll begin to understand and absorb some basic terminology.

Now, don't panic; nobody's expecting you to memorize tons of complex vocabulary or anything scary like that. The goal here (and in the next two chapters) with regard to terms is to introduce you to some basic words and general concepts intended to help you make better use of Access — as well as better understand later chapters in this book, if you choose to follow us all the way to its stunning, life-altering conclusion.

## What Is Access Good For, Anyway?

What *is* Access good for? That's a good question. Well, the list of what you can do with it is a lot longer than the list of what you *can't* do with it — of course, especially if you leave things like “wash your car” and “put away the dishes” off the “can't do” list. When it comes to data organization, storage, and retrieval, Access is at the head of the class.

### Building big databases

Okay, what do I mean by *big* database? Any database with a lot of records — and by *a lot*, I mean hundreds. At least. And certainly if you have *thousands* of records, you need a tool like Access to manage them. Although you can use Microsoft Excel to store lists of records, it limits how many you can store (no more than the number of rows in a single worksheet). In addition, you can't use Excel to set up anything beyond a simple list that can be sorted and filtered. So anything with a lot of records and complex data is best done in Access.

Some reasons why Access handles big databases well are:

- » **Typically, a big database has big data-entry needs.** Access offers not only forms but also features that can create a quick form through which someone can enter all those records. This can make data entry easier and faster and can reduce the margin of error significantly. (Check out Chapter 8 for more about building forms.)
- » **When you have lots and lots of records, you also have lots of opportunities for errors to creep in.** This includes duplicate records, records with misspellings, and records with missing information — and that's just for

openers. So you need an application such as Access to ferret out those errors and fix them. (Chapter 10 lays out how you can use Access to find and replace errors and search for duplicate entries.)

- » **Big databases mean big needs for accurate, insightful reporting.** Access has powerful reporting tools you can use to create printed and onscreen reports — and those can include as few or as many pieces of your data as you need, drawn from more than one table if need be. You can tailor your reports to your audience, from what's shown on the reports' pages to the colors and fonts used.
- » **Big databases are hard to wade through when you want to find something.** Access provides several tools for sorting, searching, and creating your own specialized tools (known as *queries*) for finding the elusive single record or group of records you need.
- » **Access saves time by making it easy to import and recycle data.** You may have used certain tools to import data from other sources — such as Excel worksheets (if you started in Excel and maxed out its usefulness as a data-storage device) and Word tables. Access saves you from reentering all your data and allows you to keep multiple data sources consistent.

## Creating databases with multiple tables

Whether your database holds 100 records or 100,000 records (or more), if you need to keep separate tables and relate them for maximum use of the information, you need a *relational* database — and that's Access. How do you know whether your data needs to be in separate tables? Think about your data — is it very compartmentalized? Does it go off on tangents? Consider the following example and apply the concepts to your data and see if you need multiple tables for your database.

### The Big Organization database

Imagine you work for a very large company, and the company has data pertaining to their customers and their orders, the products the company sells, its suppliers, and its employees. For a complex database like this one, you need multiple tables, as follows:

- » One table houses the customer data — names, addresses, phone numbers, and email addresses.
- » A second table contains the customers' orders, including the name of the customer who placed the order, the salesperson who handled the sale, shipping information, and the date of the order.

- » A third table contains information on the products the company sells, including product numbers, supplier names, prices, and the number of items in stock.
- » A fourth table contains supplier data — about the companies from which the main organization obtains its inventory of products to resell to customers. The table contains the company names, their contact person, and the address, email, and phone number information to reach them.
- » A fifth table contains employees' data — from the date they were hired to their contact information to their job title — and also contains notes about them, sort of a summary of their resumes for reference.

Other tables exist, too — to keep a list of shipping companies and their contact information (for shipping customer orders), an expense table (for the expenses incurred in running the business), and other tables that are used with the main four tables. The need for and ways to use the main tables and these additional tables are covered later in this book, as you find out how to set up tools for data entry, look up records, and create reports that provide varying levels of detail on all the data you've stored.

TIP

Because you don't have to fill in every field for each record — in any table in the database — if you don't have a phone number or don't know an email address, for example, it's okay to leave those fields blank until you've obtained that information.

## Fail to plan? Plan to fail

If you think carefully about your database, how you use your data, and what you need to know about your employees, customers, volunteers, donors, products, or projects — whatever you're storing information about — you can plan:

- » How many tables you'll need
- » Which data will go into which table
- » How you'll use the tables together to get the reports you need

Of course, everyone forgets something, and plans change after a system has already been implemented. But don't worry — Access isn't so rigid that chaos will ensue if you begin building your tables and forget something (a field or two, an entire table). You can always add a field that you forgot (or that some bright spark just told you is needed) or add a new table after the fact. But planning ahead as thoroughly as possible is still essential.

TIP

As part of thorough planning, sketch your planned database on paper, drawing a kind of flowchart with boxes for each table and lists of fields that you'll have in each one. Draw arrows to show how they might be related — it's sort of like drawing a simple family tree — and you're well on your way to a well-planned, useful database.

Here's a handy procedure to follow if you're new to the process of planning a database:

**1. On paper or in a word-processing document, whichever is more comfortable, type the following:**

- A tentative name for your database
- A list of the pieces of information you plan on getting from that database on a daily or regular basis

**2. Now, based on that information, create a new list of the actual details you could store:**

List every piece of information you can possibly think of about your customers, products, ideas, cases, books, works of art, students — whatever your database pertains to. Don't be afraid to go overboard — you can always skip some of the items in the list if they don't turn out to be things you really need to know (or can possibly find out) about each item in your database.

**3. Take the list of fields — that's what all those pieces of information are — and start breaking them up into logical groups.**

How? Think about the fields and how they work together:

- For example, if the database keeps track of a library of books, perhaps the title, publication date, publisher, ISBN (*International Standard Book Number*, which is unique for each book), price, and page count can be stored in one group, whereas author information, reviews, and lists of other titles by the same author or books on the same topic can be stored in another group. These groups become individual tables, creating your relational database of books.
- Figure out what's unique about each record. As stated in the previous point, you need a field that's unique for each record. Although Access can create a unique value for you if no unique data exists for each record in your database, it's often best to have such a field already in place, or to create such a field yourself. Customer numbers, student numbers, Social Security numbers, book ISBNs, catalog numbers, serial numbers — anything that isn't the same for any two records will do.

With a big list of fields and some tentative groupings of those fields at the ready, and with an idea of which field is unique for each record, you can begin figuring out how to *use* the data.

4. **Make a list of ways you might use the data, including:**
  - Reports you'd like to create, including a list of which fields should be included for each report
  - Other ways you can use the data — labels for mailings, product labels, catalogue data, price lists, contact lists, and so on
5. **List all the places your data currently resides.** This might be on slips of paper in your pocket, on cards in a box, in another program (such as Excel), or maybe through a company that sells data for marketing purposes.

With this planning done, you're ready to start building your database. The particulars of that process come later in this chapter and in subsequent chapters, so don't jump in yet. Do pat yourself on the back, though, because if you've read this procedure and applied even some of it to your potential database, you're way ahead of the game, and we're confident you'll make good use of all that Access has to offer.

## Databases with user forms

When you're planning your database, consider how the data will be entered:

- » If you'll be doing the data entry yourself, perhaps you're comfortable working in a spreadsheet-like environment (known in Access as *Datasheet view*), where the table is a big grid. You fill it in row by row, and each row is a record.

Figure 1-1 shows a table of volunteers in progress in Datasheet view. You decide: Is it easy to use, or can you picture yourself forgetting to move down a row and entering the wrong stuff in the wrong columns as you enter each record? As you can see, there are more fields than show in the window, so you'd be doing a lot of scrolling to the left and right to use this view.

- » You may want to use a *form* (shown in Figure 1-2) instead. A form is a specialized interface for data entry, editing, and viewing your database one record at a time, if:
  - Someone else will be handling data entry
  - Typing row after row of data into a big grid seems mind-numbing

The mind-numbing effect (and inherent increased margin for error) is especially likely when you have lots of fields in a database, and the user, if working in Datasheet view, has to move horizontally through the fields. A form like the one in Figure 1-2 puts the fields in a more pleasing format, making it easier to enter data into the fields and to see all the fields simultaneously (or only those you want data entered into).

**FIGURE 1-1:**  
Datasheet view  
can be an easy  
environment for  
data entry.  
Or not.

EventID	EventName	EventDate	EventType	LocationID	FundsNeeded	FundsRaised	Click to Add
1	Swim-a-Thon	8/15/2015	Fundraising	1	1500		
2	Sweetheart's Dance	2/14/2015	Fundraising	5	25000	30000	
3	Food Drive	6/30/2015	Collection	3	5000	6000	
4	Battle of the Bands	9/20/2015	Collection	2	15000		
5	Fundraising 101	11/15/2015	Education	4	0	0	
6	Community Hunger Seminar	12/1/2015	Education	4	2000

EventID: 1

EventName: Swim-a-Thon

EventDate: 8/15/2015

EventType: Fundraising

FundsNeeded: 1500

FundsRaised:

Record: 1 of 6

You find out all about forms in Chapter 8. If your database is large enough that you require help doing the data entry, or if it's going to grow over time, making an ongoing data-entry process likely, Access is the tool for you. The fact that it offers simple forms of data entry/editing is reason enough to make it your database application of choice.

## Databases that require special reporting

Yet another reason to use Access is the ability it gives you to create customized reports quickly and easily. Some database programs, especially those designed for single-table databases (known as *flat-file* databases), have some canned reports

built in, and that's all you can do — just select a report from the list and run the same report that every other user of that software runs.

If you're an Excel user, your reporting capabilities are far from easy or simple, and they're not designed for use with large databases — they're meant for spreadsheets and small, one-table lists. Furthermore, you have to dig much deeper into Excel's tools to get at these reports. Access, on the other hand, is a database application, so reporting is a major, up-front feature.

An example? In Excel, to get a report that groups your data by one or more of the fields in your list, you have to sort the rows in the worksheet first, using the field(s) to sort the data, and then you can create what's known as a *subtotal report*. To create it, you use a dialog box that asks you about calculations you want to perform, where to place the results, and whether you're basing a sort and/or a subtotal on more than one field. The resulting report is not designed for printing, and you have to tinker with your spreadsheet pagination (through a specialized view of the spreadsheet) to control how the report prints out.

In Access? Just fire up the Report Wizard, and you can sort your data, choose how to group it, decide which pieces of data to include in the report, and pick a visual layout and color scheme, all in one simple, streamlined process. Without you doing anything, the report is ready for printing. Access is built for reporting — after all, it is a database application — and reports are one of the most (if not *the* most) important ways you'll use and share your data.

Because reports are such an important part of Access, you can not only create them with minimum fuss but also customize them to create powerful documentation of your most important data:

- » Build a quick, simple report that just spits out whatever is in your table in a tidy, easy-to-read format. (See Figure 1-3 for an example.)
- » Create a customized report that you design step-by-step with the help of the Report Wizard. (See Figure 1-4.) The report shown in the figure has the volunteers sorted by their last names. These options were easily put to work with just a few clicks.
- » You can really roll up your sleeves and design a new report, or play with an existing one, adding all sorts of bells and whistles. Figure 1-5 shows this happening in Design view. Note that the report's title (Volunteers List by Status) is selected: It has a box around it and tiny handles on the corners and sides of the box, which means you can reformat the title, change the font, size, or color of the text, or even edit the words if a new title is needed.
