BLACKWELL STUDIES IN GLOBAL ARCHAEOLOGY

Series Editors: Lynn Meskell and Rosemary A. Joyce

Blackwell Studies in Global Archaeology is a series of contemporary texts, each carefully designed to meet the needs of archaeology instructors and students seeking volumes that treat key regional and thematic areas of archaeological study. Each volume in the series, compiled by its own editor, includes 12–15 newly commissioned articles by top scholars within the volume's thematic, regional, or temporal area of focus.

What sets the *Blackwell Studies in Global Archaeology* apart from other available texts is that their approach is accessible, yet does not sacrifice theoretical sophistication. The series editors are committed to the idea that useable teaching texts need not lack ambition. To the contrary, the *Blackwell Studies in Global Archaeology* aim to immerse readers in fundamental archaeological ideas and concepts, but also to illuminate more advanced concepts, thereby exposing readers to some of the most exciting contemporary developments in the field. Inasmuch, these volumes are designed not only as classic texts, but as guides to the vital and exciting nature of archaeology as a discipline.

1 Mesoamerican Archaeology: Theory and Practice

Edited by Julia A. Hendon and Rosemary A. Joyce

2 Andean Archaeology

Edited by Helaine Silverman

3 African Archaeology: A Critical Introduction

Edited by Ann Brower Stahl

4 Archaeologies of the Middle East: Critical Perspectives

Edited by Susan Pollock and Reinhard Bernbeck

5 North American Archaeology

- Edited by Timothy R. Pauketat and Diana DiPaolo Loren*
- 6** The Archaeology of Mediterranean Prehistory
Edited by Emma Blake and A. Bernard Knapp
- 7** Archaeology of Asia
Edited by Miriam T. Stark
- 8** Archaeology of Oceania: Australia and the Pacific Islands
Edited by Ian Lilley
- 9** Historical Archaeology
Edited by Martin Hall and Stephen W. Silliman
- 10** Classical Archaeology
Edited by Susan E. Alcock and Robin G. Osborne
- 11** Prehistoric Britain
Edited by Joshua Pollard
- 12** Prehistoric Europe
Edited by Andrew Jones
- 13** Egyptian Archaeology
Edited by Willeke Wendrich
- 14** Social Bioarchaeology
Edited by Sabrina C. Agarwal and Bonnie A. Glencross

List of Tables and Figures

Tables

4.1 Distribution of human remains at Tikal

4.2 Sex and age distribution at Tikal

5.1 Comparison of fertility estimates for Late Woodland mid-western sites

5.2 Suchey-Brooks pubic symphysis stage known age and archaeological samples to be tested

5.3 Coimbra female pubic symphysis stages and female age distribution. The last column shows the probability of death $p(\theta)$ or sample priors and derives from the actual known distribution of ages at death

5.4 Posterior probabilities for the Coimbra female pubic symphysis sample

5.5 Comparison of Coimbra female known age and age estimates ($n = 100$), derived by several different methods.

The age-at-death distribution of the pubic symphysis reference sample is shown in the last column

5.6 Comparison of the known age Spitalfields female pubic symphysis ($n = 56$) with the estimates derived from several different methods

5.7 Demographic estimators for Ossossané ossuary

5.8 Summed probabilities of caries by age 16 in mandibular teeth

7.1 Percentage of crania classified into each geographic group, sexes pooled

8.1 Summary of study samples

8.2 Comparison of frequencies reported in skeletal populations

8.3 New York African Burial Ground frequency of hypoplasia by age group

8.4 New York African Burial Ground frequency of hypoplasia by age and sex in canines and incisors (controlling for attrition), ($n = 48$)

8.5 New York African Burial Ground frequency of hypoplasia by age group in third molars (controlling for attrition), ($n = 97$)

8.6 New York African Burial Ground frequency of hypoplasia by age intervals in mandibular canines

8.7 New York African Burial Ground frequency comparison of hypoplasia in incisors and canines, $n = 37$ (hypoplasias)

8.8 New York African Burial Ground archaeological temporal groups

8.9 New York African Burial Ground temporal analysis subsamples

9.1 Risk factors in leprosy

9.2 Risk factors in tuberculosis

10.1 Concepts of age in bioarchaeology, philosophy, psychology, social anthropology, and sociology

11.1 Developmental approaches in biological and social theory that can be used specifically in the study of bone morphology, maintenance, and loss

13.1 Distribution of single and multiple graves by age at death

13.2 Age distribution of deaths less than 20 years

13.3 Femoral length against dental age

13.4 Percentage of adult femur length attained, standardized to U.S. growth standards

13.5 Frequency of cribra orbitalia and lesions associated with porotic hyperostosis

13.6 Frequency of deciduous enamel hypoplasia

13.7 Percentage of individuals with permanent hypoplastic defects and mean

13.8 Mean defects on the maxillary central incisor and upper canine (only including those with >80% of crown height)

13.9 Number of deaths per month of life (based on 100 deaths between birth and 6 years of age)

13.10 Weaning ratios (D1-4/D0-1) among selected skeletal and modern populations

13.11 Model of survivorship and risk

14.1 Indian Knoll mortuary analysis - number of individuals having each grave good type by age cohort

14.2 Indian Knoll prevalence of long bone fractures by bone and sex

15.1 Percentage of teeth lost ante-mortem

15.2 Calculus rate by age and sex category

15.3 Prevalence of abscesses by age and sex category

15.4 Prevalence of Caries Rate and DMI by age and sex category

Figures

4.1 Schematic model showing the possible formation processes of archaeological deposits from the death of an individual until its discovery by an archaeologist. The funerary portion forms only a fraction

4.2 Ngaju Dayak of Borneo preparing the remains of a temporarily stored relative for final funerary deposition. This ceremony of secondary burial is called *tiwah* and forms a collective rite which is performed by the entire village. After their exhumation from the ground the bones are washed beside a small stream and the remaining hair and nails are removed. The cleaning of the bones is later followed by the purification of the soul. This part of the ritual is performed by a priest who circles a burning bamboo stick around the bones and chants in a sacred language. At the end of the *tiwah* the bones are buried into funeral structures above the ground (*sandung*), which already hold the remains of predeceased family members (Kuhnt-Saptodewo and Rietz 2004). The *tiwah* during which the photograph was taken lasted 38 days and involved 23 families reburying 35 deceased family members. It is subject of the documentary *Bury me Twice* by Kuhnt-Saptodewo and Kampffmeyer (1996)

4.3 Crystal cask in a wooden box at the Carthusian monastery of Mauerbach, Austria (post-funerary deposition); the container was used from 1683 to 1739 and holds the bones of King Frederick the Fair (d. 1330) from the House of Habsburg and his daughter Elizabeth (d. 1336). The bodies of King Frederick and his daughter were first exhumed by order of Emperor Maximilian I in 1514, rinsed with wine and temporarily stored in the vestry (Meyer 2000:70). When the Turks plundered the abbey in 1529 the mortuary remains were thrown out but then collected by inhabitants of the area and transported to Vienna. One year later they were returned to Mauerbach and buried in a stone coffin between 1557 and 1561. In 1683 they were threatened by the Turks

once again and when the attack was over, inserted into the container shown in this figure. After the dissolution of the monastery by Emperor Joseph II in 1782 the bones were brought to Vienna in 1789 and reburied into the Habsburg house vault at St. Stephen's, Vienna where they rest as of today in a small 18th-century coffin (Meyer 2000:70-72; Weiss-Krejci 2004:390)

4.4 Niche with human skulls in the facade of the Kaiser-Heinrich Kapelle at Kirchdorf, Tyrol, Austria (post-funerary deposition). The medieval churchyard chapel was rebuilt after the fire of 1809 (Widmoser 1970:397). The skulls, which were exhumed from the local churchyard, serve as *memento mori*. The skull on the outer left in the back row is painted, the second skull from the left in the front row shows evidence for being sawed open during an autopsy

4.5 Articulated Bronze Age skeleton from Clad Hallan, Sout Uist, Outer Hebrides, Scotland. The skeleton was found under the primary floor of a roundhouse (No. 2613). Analyses show that it is fabricated from the mummified remains of a female torso and a male head. The remains predate their deposition context by hundreds of years (non-funerary deposition)

4.6 General map of Tikal showing 16 square kilometers and Zones 1 to 7. One square measures 500 × 500 meters. The Tikal map was made by Carr and Hazard (1961:figure 1). The division into various zones is based on Moholy-Nagy (2008:figure 58)

4.7 **A** Cache 32/137 from below Stela 16, Structure 5C-17; Group 5C-1 (after unpublished drawing by Sally Bates 1963); **B** Cache 165 from tunnel in Structure 6E-146, Group 6E-2 (excavated by Dennis Puleston 1964; detail of earlier construction phase, after unpublished drawing)

4.8 **A** Problematical Deposit 76, Structure 5C-17; Group 5C-1 (after unpublished drawing by Christopher Jones 1963);

B Problematical Deposit 64 alias old Burial 51, Structure 2G-59-1st, Group 2G-1 (after Haviland 1963:figure 95)

5.1 Comparison of age-at-death distributions of early and late period burials at St. John's Church, Ashfield, Sydney

5.2 Estimates of historical fertility rates for Geneva shown as 95 percent CI ranges derived from J:A and MCM (data from Perrenoud 1984), compared with total fertility derived from life tables (circles) and fertility data (stars) given in Perrenoud (1990)

5.3 MCM and J:A, 95 percent CI for archaeological and historical data sets, showing positions of some of the samples discussed

5.4 Comparison of the hazard function calculated directly from the known age distributions (Spitalfields triangles; Coimbra stars) with the Bayesian estimated standard error range of the hazard rate for Coimbra, Spitalfields, and medieval German archaeological samples. The estimated ranges are more or less identical and do not include the significantly different known-age distributions

5.5 Data on cemental annulation analyses of 150 individuals from Isola Sacra necropolis, Ostia Antica, Italy. Of the 150 sectioned tooth roots, 53.3 percent were deemed unreadable by one or both laboratories. Age estimates based on range midpoints

5.6 Comparison of dental pathology in two Mesolithic shell midden burial sites in central Portugal. The seriated mandibles are equally distributed across the ten categories based on representation of molar sockets. **A** The frequency of caries, of abscessing, and of pre-mortem tooth loss summed to represent pathology rate on the y axis. **B** The caries rate (y axis) - number of teeth with caries as a proportion of number of intact teeth in each category

5.7 Percentage of Casa da Moura mandibular sockets empty due to postmortem tooth loss. Figures in bars refer to sample sizes for each tooth socket (highest $n = 147$)

5.8 Kleinburg ossuary, Ontario. **A** Representation of permanent tooth sockets, including congenital absence, pre-mortem and postmortem tooth loss, as a ratio of the socket with highest presence (pooled sides M₁ socket, $n = 1,092$).

B Percentage of permanent mandibular tooth sockets empty due to postmortem tooth loss (pooled sides mandibular sockets, $n = 7,657$)

5.9 Stable isotope values for Ontario sites showing the placement of Grimsby within the data set of Harrison and Katzenberg (2003)

5.10 Casa da Moura mandibular canine buccal crown heights ($n = 219$, sides pooled)

7.1 Metopic suture in individual 2775 from Écija

7.2 Os japonicum (i.e. a bipartite zygomatic bone) in the left malar of skeleton 11830 from Écija. This trait is unilaterally expressed in this individual

7.3 Map locating Écija relative to Sevilla and Córdoba in Andalucía

7.4 Strontium isotope ratios (Sr 87/86) by individual. Solid line represents mean value for the human samples. Dashed lines are two standard deviations from this sample mean

7.5 Plot of first two principal components (sexes pooled)

7.6 Plot of first two discriminant functions (sexes pooled)

8.1 New York African Burial Ground mortality

8.2 New York African Burial Ground, Burial 1, a woman who died between the ages of 20 and 25 years, displaying linear enamel hypoplastic lesions in the anterior maxillary permanent dentition

8.3 New York African Burial Ground, Burial 9, a man who died between the ages of 35 and 45 years, displaying linear enamel hypoplasia in the permanent mandibular canine and lateral incisor

8.4 New York African Burial Ground hypoplasia in third molars ($n = 111$)

8.5 New York African Burial Ground mortality by sex and age

8.6 New York African Burial Ground hypoplasia frequencies in deciduous dentition across temporal groups

8.7 New York African Burial Ground frequency of hypoplasia: Early groups (Early and Middle groups combined, representing the late 17th century to approximately 1760)

8.8 New York African Burial Ground frequency of hypoplasia: Latter groups (Late Middle and Late groups combined, representing approximately 1760 to 1794)

8.9 New York African Burial Ground Harris Line frequencies by temporal group

8.10 New York African Burial Ground, Burial 122, a woman who died between the ages of 18 to 20 years. Her burial dates to the Middle temporal group (approximately 1735-1760)

8.11 New York African Burial Ground, Burial 47, a man who died between the ages of 35 and 45 years. His burial dates to the Middle temporal group (approximately 1735-1760)

8.12 New York African Burial Ground, Burial 40, a woman who died between the ages of 50 and 60 years of age. Her burial was assigned to the Late temporal group (approximately 1776-1794)

9.1 The immune spectrum of leprosy after Ridley and Jopling (1966)

9.2 Radiograph of a person's hands affected by the bone changes of leprosy

9.3 Vietnamese beliefs about tuberculosis

9.4 Woman with tuberculosis affecting the spine

9.5 Anterior view of the face of a woman who suffered leprosy during life and buried in St. Stephen's churchyard, York

9.6 North side of the “Ripon leprosy chapel,” North Yorkshire; note the lower window in the wall allegedly for people with leprosy to view the religious service in the late medieval period

9.7 Spine of an individual with tuberculosis buried in post-medieval Oxfordshire, England

9.8 Visceral surface of a rib head with a small amount of very subtle new bone formation, reflecting a pulmonary infection

9.9 Sanatorium of the early 20th century in Keighley, West Yorkshire

11.1 Diagrammatic model of the plasticity in development and maintenance of the skeleton over the life course

13.1 Map of Bahrain and the Arabian Gulf

13.2 Cortical thinning resulting in a lattice-like pattern due to marrow expansion on infant bones (one ilium, two pubi, one ischium, one vertebral arch, and one metacarpal)

13.3 Remodeling and cranial thickening in an adult with healed porotic hyperostosis. There is still marked bossing on both parietals with the surface showing infilling of cribrotic and porotic areas

13.4 Multiple linear enamel defects on unerupted permanent tooth crowns

13.5 Distribution of linear enamel hypoplasia by dental development unit

13.6 Distribution of gestational ages among infants less than three months of age at death, based on regression of femur length

13.7 Dental development unit in which first linear hypoplastic defect occurs

14.1 A healed childhood supracondylar fracture of distal humerus from Indian Knoll. Note the subtle posterior displacement of the articular region when viewed from the lateral side

14.2 Graph showing Indian Knoll fracture distributions across the life course - collective, males and females separately

14.3 Graphic representation of the traditional life cycle

15.1 Map showing Portus Romae (Porto) comprising both Porto di Claudio and Porto di Traiano

15.2 Scatter plot of the Isola Sacra rib data ($n = 37$), showing $\delta^{15}\text{N}$ and $\delta^{13}\text{C}$ versus estimated age-at-death. Solid horizontal line represents the adult female $\delta^{15}\text{N}$ mean; dashed horizontal line represents the adult female $\delta^{13}\text{C}$ mean

15.3 Histograms of $\delta^{15}\text{N}$ and $\delta^{13}\text{C}$ by age category

15.4 Age and sex distribution of the Isola Sacra permanent dentition sample ($n = 325$)

15.5 Percent AMTL by age and sex category

15.6 Caries Rate and DMI (Diseased Missing Index) by age and sex category

15.7 Tooth wear scores by age category

Notes on Contributors

Sabrina C. Agarwal is an Assistant Professor in the Department of Anthropology at the University of California Berkeley. She received her B.A. and M.Sc. from the University of Toronto, and Ph.D. from the same institution, working jointly in the Samuel Lunenfeld Research Institute of Mount Sinai Hospital, Toronto, and subsequently enjoyed two years as a Social Sciences and Humanities Research Council (SSHRC) Postdoctoral Fellow in the Department of Anthropology at McMaster University. Her research interests are focused broadly upon the age- and sex-related changes in bone quantity and quality, and particularly in the application of biocultural and evolutionary approaches to the study of bone fragility. More recently, she is particularly interested in the application of research in bone maintenance to dialogues of social identity and embodiment in bioarchaeology. She has examined age-related changes in cortical bone microstructure, trabecular architecture, and mineral density in several British archaeological populations, and is currently examining the long-term effect

of growth and reproduction on the human and non-human primate maternal skeleton, studying samples from Turkey and Japan. She has recent publications in the *American Journal of Physical Anthropology*, and is co-editor of the volume *Bone Loss and Osteoporosis: An Anthropological Perspective* (with Sam Stout).

Valerie A. Andrushko is an Assistant Professor in the Department of Anthropology at Southern Connecticut State University. She received her Ph.D. in 2007 from the University of California, Santa Barbara. Since 1999, she has led a regional research program on prehistoric human burials from Cuzco, Peru, the ancient capital of the Inca Empire. Her recent articles include “Prehistoric Trepanation in the Cuzco Region of Peru: A View into an Ancient Andean Practice” (with John Verano; 2008) and “Strontium Isotope Evidence for Prehistoric Migration at Chokepukio, Valley of Cuzco, Peru” (with Michele Buzon et al.; 2009). Along with her long-standing research program in Cuzco, she has also investigated trophy-taking among prehistoric groups in California (“Trophy-Taking and Dismemberment as Warfare Strategies in Prehistoric Central California” with Al Schwitalla et al.; 2010).

George J. Armelagos is the Goodrich C. White Professor of Anthropology at Emory University in Atlanta, Georgia. His research has focused on diet and disease in human adaptation. He has co-authored *Demographic Anthropology* (with Alan Swedlund) and *Consuming Passions: The Anthropology of Eating* (with Peter Farb), and has co-edited *Paleopathology at the Origins of Agriculture* (with Mark Cohen) and *Disease in Populations in Transition: Anthropological and Epidemiological Perspective* (with Alan Swedlund). He has authored or co-authored over 260 articles and has had four of his papers reprinted 60 times. He has been President of American Association of Physical Anthropologists and Chair of the Anthropology Section of the

American Association for the Advancement of Science. He is the recipient of the Viking Fund Medal for 2005, one of anthropology's highest honor. He was the Distinguished Lecturer for the Biological Anthropology Section of the American Anthropological Association for 2005. In 2008, the American Anthropological Association awarded him the Franz Boas Award for Exemplary Service. In 2009, he received the Charles Darwin Award for Lifetime Achievement from the American Association of Physical Anthropologists.

Autumn R. Barrett is Assistant Director of the Institute for Historical Biology at the College of William and Mary, and Adjunct Assistant Professor at the College of William and Mary and Virginia Commonwealth University. She received her M.A. from the College of William and Mary, where she is currently a Ph.D. candidate. She specializes in historical anthropology of the African Diaspora, combining bioarchaeological, ethnographic, and documentary analyses. She was a contributor to the skeletal biology component of the New York African Burial Ground Research Project. Her research interests include childhood health within the context of life histories, the role of childhood and child labor in colonialism and nation-building, and the political economy of historical narratives. Her dissertation compares representations of African enslavement and revolt in Brazil and the United States, focusing on dialogue and socio-political contest surrounding the commemoration of two historic African cemeteries.

Patrick Beauchesne is currently a Ph.D. candidate at University of California Berkeley. He earned his master's degree from the University of Western Ontario and his bachelor's from McMaster University. His research interests began with histological investigations of bone pathology in archaeological skeletal remains and now include skeletal biology, growth and development, applications of computed

tomography in biological anthropology, life history and evolutionary theory, and bioarchaeology. He has bioarchaeological field and laboratory experience in various countries including Peru, Italy, and Turkey. His most recent publication, Beauchesne and Saunders (2006), dealt with applying a simple hand-grinding method to the production of bone histological slides using archaeological skeletons. His current dissertation work involves exploring growth and development, physiological stress and life history theory in a Roman archaeological assemblage.

Michael L. Blakey is the National Endowment for the Humanities Professor of Anthropology, Professor of American Studies, and Founding Director of the Institute for Historical Biology at the College of William and Mary. He is a key advisor on prominent museum projects including the Race Exhibition of the American Anthropological Association and the National Museum of African American History and Culture of the Smithsonian Institution, where he held several prior research positions at the Natural History Museum. He was Scientific Director of New York City's colonial African Burial Ground archaeological site that has become a National Monument. He has numerous publications in flagship journals on bioarchaeology, race, racism, ethics, and the history of anthropology. He has held professorships at Spelman College, Columbia, Brown, Rome, and Howard University where he founded the W. Montague Cobb Biological Anthropology Laboratory.

Bonnie A. Glencross is an Assistant Professor in the Department of Archaeology and Classical Studies at Wilfrid Laurier University in Ontario, Canada. Bonnie studied at the University of Toronto where she received her B.Sc., M.A. and Ph.D. (2003) in anthropology, and produced her doctoral thesis on skeletal injury patterns and lifetime fracture risk in prehistoric hunter-gatherers from Indian Knoll, Kentucky. Beginning in 2006, she held a two-year Social Sciences and
