SpringerBriefs in Physics

Series Editors

Balasubramanian Ananthanarayan, Centre for High Energy
Physics, Indian Institute of Science, Bangalore, India

Egor Babaev, Department of Physics, Royal Institute of
Technology, Stockholm, Sweden

Malcolm Bremer, H H Wills Physics Laboratory, University of
Bristol, Bristol, UK

Xavier Calmet, Department of Physics and Astronomy,
University of Sussex, Brighton, UK

Francesca Di Lodovico, Department of Physics, Queen Mary
University of London, London, UK

Pablo D. Esquinazi, Institute for Experimental Physics II,
University of Leipzig, Leipzig, Germany

Maarten Hoogerland, University of Auckland, Auckland, New
Zealand

Eric Le Ru, School of Chemical and Physical Sciences, Victoria
University of Wellington, Kelburn, Wellington, New Zealand

Dario Narducci, University of Milano-Bicocca, Milan, Italy

James Overduin, Towson University, Towson, MD, USA

Vesselin Petkov, Montreal, QC, Canada

Stefan Theisen, Max-Planck-Institut für Gravitationsphysik,
Golm, Germany

Charles H.-T. Wang, Department of Physics, The University of
Aberdeen, Aberdeen, UK

James D. Wells, Physics Department, University of Michigan,
Ann Arbor, MI, USA

Andrew Whitaker, Department of Physics and Astronomy,
Queen's University Belfast, Belfast, UK

SpringerBriefs in Physics are a series of slim high-quality publications encompassing the entire spectrum of physics. Manuscripts for SpringerBriefs in Physics will be evaluated by Springer and by members of the Editorial Board. Proposals and other communication should be sent to your Publishing Editors at Springer.

Featuring compact volumes of 50 to 125 pages (approximately 20,000–45,000 words), Briefs are shorter than a conventional book but longer than a journal article. Thus, Briefs serve as timely, concise tools for students, researchers, and professionals.

Typical texts for publication might include:

- A snapshot review of the current state of a hot or emerging field
- A concise introduction to core concepts that students must understand in order to make independent contributions
- An extended research report giving more details and discussion than is possible in a conventional journal article
- A manual describing underlying principles and best practices for an experimental technique
- An essay exploring new ideas within physics, related philosophical issues, or broader topics such as science and society

Briefs allow authors to present their ideas and readers to absorb them with minimal time investment. Briefs will be published as part of Springer's eBook collection, with millions of users worldwide. In addition, they will be available, just like other books, for individual print and electronic purchase. Briefs are characterized by fast, global electronic dissemination, straightforward publishing agreements, easy-to-use manuscript preparation and formatting guidelines, and expedited production schedules. We aim for publication 8–12 weeks after acceptance.

Acknowledgements

This review was originally prepared by the author working with the Foundational Questions Institute, FQXi, for the John Templeton Foundation. Anthony Aguirre, Adam Brown, David Tong, and Mark Van Raamsdonk generously took the time to read portions of the draft and provide detailed feedback. I started to collect material for this review while a Director's Visitor at the Institute for Advanced Study and would like to thank Robbert Dijkgraaf, Nima Arkani-Hamed, and Josephine Faass for making that possible. Over the years, I have been privileged to learn from the world's leading physicists and philosophers of physics, who are a remarkably patient and good-humored lot. Unable to list them all here, I thank them as a community. Elfy Chiang created the Quantum Hall Effect graphic in Chap. 2, and Maayan Harel developed the spacetime-holography graphic in Chap. 3—how lucky I was to work with such talented artists. I am delighted to have come to know Thomas Burnett from the John Templeton Foundation, who coordinated the FQXi/JTF reviews. I have been honored to work with Angela Lahee, Ashok Arumairaj, and Sindhu Sundararajan at Springer to translate the Templeton project into a hardcopy volume. And Zeeya Merali—I have known her for much of my career and never ceased to learn from her incisive writing and editing. I can think of no more knowledgeable editor I could have worked with on this project.

Contents

1	Introduction	1
1.1	What is Emergence?	2
1.2	Is Emergence Fundamental?	6
1.3	Weak Versus Strong Emergence	7
	References	8
2	Emergence in Condensed Matter Physics	11
2.1	Introduction	12
2.1.1	Just a Phase They're Going Through—Landau's Theory of Phase Transitions	13
2.1.2	Tipping the Scales	16
2.1.3	Non-equilibrium Phases of Matter	17
2.2	Soft Matter	18
2.3	Quantum Phases of Matter	19
2.3.1	Quantum Physics	20
2.3.2	Frozen yet Mobile—Superconductors, Bose–Einstein Condensates, and Strange Metals	21
2.3.3	Critical Symmetry	22
2.3.4	“Twistronics”—Graphene's Magic Angle	22
2.4	Topological Phases of Matter	24
2.4.1	The Hall Effects	26
2.4.2	Topological Insulators and Topological Nanomaterials	28

2.4.3	Hunting for New Topological Materials—Can A.I. Help?	30
2.4.4	Entangled in More Ways Than One—Topological Quantum Computing	31
2.4.5	Topological Inspiration for Other Areas of Science	33
2.5	Condensed Matter and the Unification of Physics—The String-Net-Liquid-Model	33
	References	35
3	Emergence of Space	45
3.1	Introduction—Is Spacetime Doomed?	46
3.1.1	Einstein’s Space	48
3.1.2	Hints that Space Is Emergent	49
3.2	Space from Entanglement	53
3.2.1	The Universe as a Hologram—The AdS/CFT Duality	53
3.2.2	Why Entanglement?	57
3.2.3	How Entanglement Reproduces Space	59
3.2.4	Space as Error Correction	61
3.3	Black Holes	64
3.3.1	Down the Wormhole—Resolving the Black-Hole Information Paradox	64
3.3.2	Island Rule	66
3.3.3	Complexity and Black Holes	68
3.3.4	Testing Emergence in the Lab: Black Hole Scrambling	69
3.4	Extending Duality	71
3.4.1	Going Beyond AdS/CFT	71
3.4.2	Loop Quantum Gravity	73
3.4.3	Causal Sets	74
3.4.4	Causal Dynamical Triangulations	75
	References	76

4 Lateral Thinking—The Holographic Principle in Condensed Matter	85
4.1 Introduction	85
4.2 Dualing Theories	87
4.2.1 Nuclear Plasmas and Holography	87
4.2.2 Quantum Phases and Holography	88
4.3 The SYK Model—Creating Spacetime from Particles	90
