Preface

Reading this Book

The primary purpose of this book is to provide you with a good knowledge of the concept and functionality of Microsoft Dynamics 365 for Finance and Operations. As a result, you should be able to execute business processes in the application on your own. It is primarily designed for users, students, and consultants who are interested in learning how to use the application.

Going beyond the operations on the user interface, you learn how the different parts of the application work together. For this reason, also system administrators, developers, IT executives, or consultants who do not know all the details of the application take advantage of getting to know the end-to-end concept.

The best way to learn an application is to use it. For that reason, this book includes exercises that build up on each other in a comprehensive case study. If you need support with the exercises, download the illustrated sample solutions.

Microsoft Dynamics 365 for Finance and Operations is a very comprehensive business solution, which makes it impossible to explain all parts of the application in a single book. In order to provide a profound understanding of the core application, this book addresses the core functionality in the supply chain (including trade and logistics, and production control) and finance management. It covers the application but does not cover tasks in system administration and development.

Microsoft Dynamics 365 Version

This book is based on version 8.1 of Microsoft Dynamics 365 for Finance and Operations (released in October 2018). It is an update of my previous book editions on Dynamics AX. In order to avoid repeating the current long name, the short name “Dynamics 365” is used for the application in most parts of this book.

Applicable Settings

In Dynamics 365, you can individually select the language of your user interface. Descriptions and illustrations in this book refer to the language “EN-US” (United States English). Whereas it is obvious that the Dynamics 365 client shows different labels when you select languages like Spanish or Russian, there are also differences when you select British English. For example, the label for the field “Sales tax” is “VAT” in British English. Other differences between your application and the

descriptions in the book are possibly caused by permission settings, by local features, by later updates, or by modifications and add-ons in your application.

In order to benefit from the explanations, it is recommended to practice with Dynamics 365. A separate test application, which you can use to execute the exercises, is required to avoid an impact on actual company data.

The illustrations and the exercises in this book refer to the Microsoft standard demo environment with the company “Contoso Entertainment System USA” (“USMF”). For the screenshots, the color theme “High contrast” and a small element size has been selected in the visual preferences of the user options. In order to grant a flexible choice of your training environment, the tasks in the exercises are specified in a way that you can use any Dynamics 365 test environment of your choice.

Available Support

You can download the exercise guide for the exercises in this book and other applicable resources from the online service of the publisher, or from my website:

<http://D365book.addyn.com>

If you have comments or questions regarding the book or the exercises, please contact me via this website or e-mail to *lua@addyn.com*.

Acknowledgments

Many people have been involved in finalizing this book, directly and indirectly, from the first to the current edition. Thank you to all of them. In particular, I would like to mention Matthias Gimbel (STZ IT Business Consulting), Ingo Maresch (Solutions Factory Consulting), and Finn Nielsen-Friis (AXcademy).

Thank you also to the editor, Sabine Kathke, and to my family – Sonja, Felix, and Caroline.

Andreas Luszczyk

Table of Contents

1	What is Microsoft Dynamics 365/AX?	1
1.1	Dynamics 365, Dynamics AX and Axapta.....	1
1.2	Dynamics 365 for Finance and Operations at a Glance	2
1.2.1	Functional Capabilities	2
1.2.2	Implementation.....	3
1.2.3	Data Structure	4
1.2.4	Voucher Principle	4
2	Getting Started: Navigation and General Options	5
2.1	User Interface and Common Tasks	5
2.1.1	Login and Authentication.....	5
2.1.2	Navigation	5
2.1.3	Elements of the User Interface	9
2.1.4	Working with Records	17
2.1.5	Filtering and Sorting.....	23
2.1.6	Help System.....	28
2.1.7	Case Study Exercises	29
2.2	Printing and Reporting.....	30
2.2.1	Printing Documents.....	30
2.2.2	Microsoft Office Integration.....	35
2.2.3	Case Study Exercise	37
2.3	Advanced Options.....	37
2.3.1	User Options and Personalization.....	37
2.3.2	Record Information and Templates	41
2.3.3	Case Study Exercises	44
2.4	Global Address Book.....	44
2.4.1	Parties and Addresses.....	44
2.4.2	Address Books.....	46
2.4.3	Case Study Exercise.....	47
3	Purchase Management	49
3.1	Business Processes in Purchasing	49
3.1.1	Basic Approach	49
3.1.2	At a Glance: Purchase Order Processing	52

3.2	Vendor Management	54
3.2.1	Vendor Records.....	54
3.2.2	Payment Terms and Cash Discounts.....	59
3.2.3	Ledger Integration	62
3.2.4	Case Study Exercises	63
3.3	Product Management in Purchasing	64
3.3.1	Product Categories and Procurement Categories	64
3.3.2	Basic Product Data	66
3.3.3	Purchase Price Setup	71
3.3.4	Case Study Exercises	76
3.4	Purchase Order Management.....	76
3.4.1	Basics of Purchase Order Processing.....	76
3.4.2	Purchase Order Registration	79
3.4.3	Change Management and Purchase Order Approval	86
3.4.4	Canceling and Deleting Purchase Orders.....	88
3.4.5	Purchase Inquiries and Order Confirmations.....	89
3.4.6	Case Study Exercises	92
3.5	Item Receipts.....	93
3.5.1	Basics of Item Receipts	93
3.5.2	Receipts Lists	94
3.5.3	Inventory Registration.....	94
3.5.4	Product Receipts.....	98
3.5.5	Partial Delivery, Underdelivery, and Overdelivery.....	100
3.5.6	Order Status and Inquiries.....	102
3.5.7	Case Study Exercises	105
3.6	Invoice Receipts.....	106
3.6.1	Processing Vendor Invoices.....	106
3.6.2	Order Status and Inquiries.....	111
3.6.3	Case Study Exercises	113
3.7	Vendor Credit Notes and Item Returns	114
3.7.1	Crediting and Returning.....	114
3.7.2	Credit Notes without Item Return.....	116
3.7.3	Case Study Exercise	117
3.8	Purchase Agreements, Requisitions, and Quotation Requests	118
3.8.1	Purchase Agreements.....	118
3.8.2	Purchase Requisitions	119
3.8.3	Requests for Quotation.....	121
3.8.4	Case Study Exercise	124

4	Sales and Distribution.....	125
4.1	Business Processes in Sales and Distribution.....	125
4.1.1	Basic Approach	125
4.1.2	At a Glance: Sales Order Processing	128
4.2	Customer Management.....	130
4.2.1	Core Data in the Customer Records.....	130
4.2.2	Case Study Exercise.....	133
4.3	Product Management in Sales.....	134
4.3.1	Product Data and Sales Categories.....	134
4.3.2	Sales Price and Discount Setup	135
4.3.3	Case Study Exercises	140
4.4	Sales Order Management.....	141
4.4.1	Basics of Sales Order Processing.....	141
4.4.2	Sales Quotations.....	142
4.4.3	Sales Order Registration	144
4.4.4	Order Prices and Discounts.....	151
4.4.5	Surcharge Management	153
4.4.6	Sales Order Confirmations	155
4.4.7	Case Study Exercises	156
4.5	Delivery Management.....	157
4.5.1	Basics of Picking and Shipping.....	157
4.5.2	Pick Form and Picking Lists.....	159
4.5.3	Picking Workbench	162
4.5.4	Packing Slips.....	164
4.5.5	Case Study Exercises	166
4.6	Sales Invoices.....	167
4.6.1	Sales Order Invoices	167
4.6.2	Collective Invoices	168
4.6.3	Free Text Invoices	170
4.6.4	Case Study Exercises	172
4.7	Sales Credit Notes and Item Returns	173
4.7.1	Return Order Management	173
4.7.2	Simple Credit Notes	176
4.7.3	Case Study Exercise.....	177
4.8	Direct Deliveries.....	177
4.8.1	Processing Direct Deliveries.....	177
4.8.2	Case Study Exercise.....	180
4.9	Trade Allowances and Incentive Management	180

4.9.1	Trade Allowances	180
4.9.2	Broker Contracts.....	187
4.9.3	Royalty Agreements	188
4.9.4	Vendor Rebates	188
5	Production Control.....	189
5.1	Business Processes in Manufacturing.....	189
5.1.1	Basic Approach.....	189
5.1.2	At a Glance: Production Order Processing.....	192
5.2	Product Management and Bills of Materials	194
5.2.1	Product Data in Manufacturing	194
5.2.2	Bills of Materials (BOM).....	196
5.2.3	Case Study Exercises	203
5.3	Resource and Route Management	204
5.3.1	Working Time Calendars and Templates	205
5.3.2	Resource Groups and Resource Management	206
5.3.3	Routes and Operations.....	212
5.3.4	Case Study Exercises	220
5.4	Production Order Management	221
5.4.1	Basics of Production Order Processing	221
5.4.2	Production Order Registration.....	222
5.4.3	Processing Production Orders.....	225
5.4.4	Case Study Exercises	231
5.5	Consumption of Material and Resource Capacity	231
5.5.1	Journal Setup and Ledger Integration.....	232
5.5.2	Picking Lists.....	233
5.5.3	Resource Usage	235
5.5.4	Case Study Exercises	236
5.6	Reporting as Finished and Ending Production.....	236
5.6.1	Reporting as Finished.....	236
5.6.2	Ending and Costing	239
5.6.3	Case Study Exercise	241
5.7	Subcontracting	241
5.7.1	External Resources.....	241
5.7.2	Purchased Services.....	242

1 What is Microsoft Dynamics 365/AX?

Microsoft Dynamics 365 is a cloud-based business platform for enterprises that comprises the functionality of ERP and CRM solutions. Within Dynamics 365, there are several applications (apps) for the different areas of business. In that regard, Dynamics 365 for Finance and Operation, the solution which is covered by this book, is the application that includes the ERP functionality for mid-sized companies and multinational organizations. Based on state-of-the-art architecture, it offers high usability and comprehensive functionality.

Initially published with the name Dynamics AX 7 (officially without the version number), Dynamics 365 for Finance and Operations is designed as a cloud-based solution on the Microsoft Azure platform, but an on-premise deployment on customer infrastructure is also possible. The browser-based client in Dynamics 365, which you can run on most operating systems and browsers, replaces the Windows client in previous (Dynamics AX) versions of the application.

1.1 Dynamics 365, Dynamics AX and Axapta

Dynamics 365 for Finance and Operations has been initially developed under the name “Axapta” by Damgaard A/S, a Danish software company. The founders of Damgaard, Erik and Preben Damgaard, have before been co-founders of PC&C, the company that has developed Navision (later “Dynamics NAV”).

The first official version of Axapta, version 1.0, has been released in March 1998 for Denmark and the USA. Version 1.5, published in October 1998, has added the country-specific functionality for several European countries. With the release of version 2.0 in July 1999 and version 3.0 in October 2002, Axapta has been introduced in further countries with a wide range of functional enhancements.

Based on a merger agreement in November 2000, Damgaard A/S united with the local rival Navision A/S, a successor of PC&C. Microsoft subsequently acquired Navision-Damgaard in May 2002 and accepted the main products of this company, Navision and Axapta, as core business solutions in the software portfolio. Navision has been positioned as the solution for small, Axapta for large companies.

With version 4.0 in June 2006, Microsoft has rebranded Axapta to Dynamics AX. Apart from functional enhancements, Dynamics AX 4.0 has introduced a redesigned user interface with a Microsoft Office-like look and feel.

Dynamics AX 2009, which has included the role centers, the workflow functionality, and an updated user interface as core innovations, has been published in June 2008. This version has also added substantial functional features

(including the multisite foundation and new modules) that ensure end-to-end support for the supply chain requirements of global organizations.

Dynamics AX 2012, which has been published in August 2011, has introduced a further update of the user interface with list pages and action panes across the whole application. The role-based security, the accounting framework with segmented account structures, the enhanced use of shared data structures, and other features have facilitated the collaboration across legal entities and operating units within the application. Updated versions of Dynamics AX 2012 have been released later: The Feature Pack in February 2012 (adding industry features for retail and process manufacturing), R2 in December 2012 (adding data partitions, additional country features, and Windows 8 support), and R3 in May 2014 (adding the advanced warehouse and transportation management solution).

In March 2016, the first version of the current solution (a cloud-based application with a web client) has been published with the name Dynamics AX 7. In comparison to Dynamics AX 2012, the technical foundation has been completely new, but there have not been many changes in the functionality. In line with the principle of a cloud-based solution, technical and functional updates are introduced continuously. Examples of functional and technical enhancements are the on-premise version and the mobile app in July 2017. With the integration into the Dynamics 365 platform in November 2016, the new name “Dynamics 365 for Operations” has been given to Dynamics AX. The final name “Dynamics 365 for Finance and Operations” has been introduced with the update in July 2017.

1.2 Dynamics 365 for Finance and Operations at a Glance

Microsoft Dynamics 365 for Finance and Operations is a business solution that meets the complex requirements of multinational enterprises but is still easy to use.

Because of its intuitive user interface, most people feel comfortable with Dynamics 365 from the very beginning. Along with the tight integration of other Microsoft cloud services, this helps to start working in Dynamics 365 easily and efficiently. Dashboards, which are the start page when opening Dynamics 365, grant easy and fast access to all required areas of the application.

1.2.1 Functional Capabilities

The end-to-end support of business processes across the whole organization enables the integration of internal organization units (e.g., companies or departments) and external business partners (e.g., customers or vendors) in Dynamics 365.

Multi-language, multi-country, and multi-currency capabilities, the organization model that includes multiple hierarchies of operating units and legal entities, and the option to manage multiple sites within one legal entity, make it possible to manage complex global organizations within a common database.

The functional capabilities of Dynamics 365 for Finance and Operations include the following main areas:

- **Sales and marketing**
- **Supply chain management**
- **Procurement and sourcing**
- **Production control**
- **MRP (Material requirements planning / Master planning)**
- **Warehouse management**
- **Financial management**
- **Cost accounting and cost management**
- **Budgeting**
- **Project management and accounting**
- **Service management**
- **Human capital management**
- **Business intelligence and reporting**

In addition to the core ERP functionality, industry-specific features for distribution, manufacturing, retail, services, and the public sector are included in the standard application and provide a broad industry foundation. Local features meet the particular requirements of different countries. By default, applicable local features are controlled by the country of the primary address of the company (legal entity).

The integrated reporting features and the option to embed business intelligence reports and visualizations grant a fast and reliable presentation of business data. Business intelligence features are not only available to users in finance and accounting, but to the users in all areas of Dynamics 365 who need to analyze their data.

1.2.2 Implementation

Starting with the release that has been published in July 2017, you can deploy Dynamics 365 for Finance and Operations on Microsoft Azure in the cloud, or on-premise in a data center of your company.

The Microsoft Dynamics Lifecycle Services – a portal solution on Microsoft Azure that includes a collaborative environment and continuously updated services for the management of Dynamics 365 deployments – are the starting point for a Dynamics 365 implementation.

Microsoft usually does not sell Dynamics 365 directly to customers but offers an indirect sales channel. Customers purchase licenses from certified partners, who provide their services for the implementation. These services include application consulting, system setup, and the development of enhancements.

1.2.3 Data Structure

In Dynamics 365, you work with data that describe transactions – for example, the inventory transactions of an item. As a prerequisite for the transactions, you need to manage data which describe the objects in transactions – for example, the item itself. Including the data that control the configuration, there are three data types:

- **Setup data**
- **Master data**
- **Transaction data**

Setup data specify the way in which business processes work in Dynamics 365. The setup determines, for example, whether warehouse locations or serial numbers are used. Apart from the development of enhancements, the setup is the primary way to adapt the application to the requirements. Setup data are entered with the initial setup of the application. Later changes need to be checked carefully.

Master data describe objects like customers or products. They are not updated periodically, but at the time when there are changes on the object – for example, when a customer changes the delivery address. Master data are entered or imported initially before a company starts working in the application. Depending on the business, there are only occasional updates of master data later on.

Transaction data are continuously updated with the activities in business processes. Examples of transaction data are sales orders, invoices, or inventory transactions. Dynamics 365 generates transaction data with every business activity. The registration and the posting of transactions comply with the voucher principle.

1.2.4 Voucher Principle

If you want to post a transaction, you have to register a voucher with a header and one or more lines. Processing a voucher includes two steps:

- **Registration** – Enter the voucher (create the initial document).
- **Posting** – Post the voucher (create the posted document).

Vouchers are based on master data – for example, the main accounts, customers, or products. It is not possible to post a voucher as long as it does not comply with the rules that are defined by setup data or given by the internal business logic of Dynamics 365 (which, for example, requires that an inventory transaction has to include a serial number if serial number control is active). Once a voucher is posted, it is not possible to change it anymore. Depending on the setup, approval in a Dynamics 365 workflow may be required before it is possible to post the transaction. Examples of vouchers are orders in sales and purchasing or journals in finance and inventory management. The related posted documents are packing slips, invoices, ledger transactions, or inventory transactions.

Note: Some minor vouchers like quarantine orders show an exception regarding the voucher structure – they do not consist of a header and separate lines.

2 Getting Started: Navigation and General Options

One of the core principles of Microsoft Dynamics 365 is to grant an intuitive and smooth user experience. But business software supports business processes that may be quite complex. For this reason, it is important to know the basics.

2.1 User Interface and Common Tasks

Before a description of the business processes in Dynamics 365 in the subsequent chapters, this section gives an overview of the general functionality.

2.1.1 Login and Authentication

Microsoft Dynamics 365 is a cloud-based solution which requires to sign in with a Microsoft Azure Active Directory user account (Microsoft Office 365 account). You can access Dynamics 365 in two different ways:

- **Web client** – Described below, provides full access to all functional areas.
- **Mobile app** – Provides access to functionality which is relevant for users on phones and tablets (see section 10.5.4).

In order to access the Dynamics 365 web client, start a supported web browser like Microsoft Edge or Google Chrome and open the web address (URL) of your Dynamics 365 application. The browser subsequently shows the login dialog, in which enter your Azure Active Directory user ID (Email) and password.

Settings in your user options determine the current company (legal entity) and the language in Dynamics 365 after logging on. Parameters in the web address of the Dynamics 365 application can override these user settings, and they provide further options. The web address *https://XXX.com/?&cmp=FRSI&lng=fr* (XXX.com = Dynamics 365 URL), for example, opens the company “FRSI” in French.

If you want to log off, click the icon with your user initials on the right of the Dynamics 365 navigation bar and select the option *Sign out*.

2.1.2 Navigation

There are four ways to access pages and forms in the Dynamics 365 web client:

- **Dashboard and workspaces**
- **Navigation pane**
- **Navigation search**
- **Favorites**

The Dynamics 365 dashboard (see section 2.1.3) is the default initial page in Microsoft Dynamics 365. It contains all workspaces which are available to the

current user. In the dashboard, you can open a workspace, and in the workspace, you can subsequently access the related list pages and detail forms.

2.1.2.1 Navigation Pane

The navigation pane provides access to all workspaces, list pages, and forms, for which you have got appropriate permissions. Apart from the *Modules* pane, which contains all your menu items, and the *Workspaces* pane, which contains your workspaces, it includes the *Favorites* pane, in which can place a limited number of menu items for frequent use.

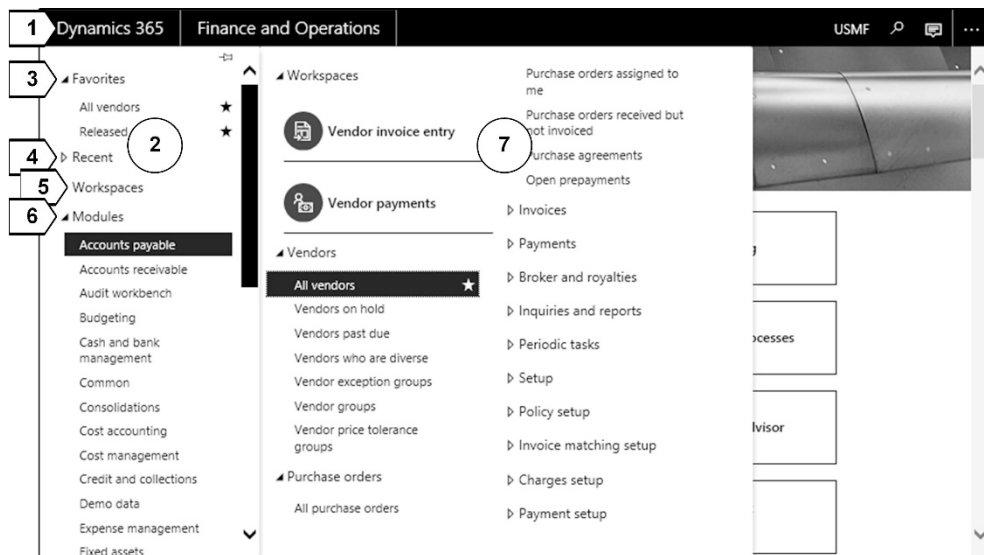

Figure 2-1: Navigation pane and menu in Dynamics 365

If you want to display the complete navigation pane, press the shortcut key *Alt+F1* or click the button  (*Show navigation pane*) on the left of the Dynamics 365 client. Dynamics 365 then shows the following navigation elements (see Figure 2-1):

- **Navigation bar** [1]
- **Navigation pane** [2]
- **Favorites** [3]
- **Recent** [4]
- **Workspaces** [5]
- **Modules** [6]
- **Menu for the selected module** [7]

If you want to view the navigation pane [2] permanently, click the button  (*Pin navigation pane open*) on the right of the navigation pane. If you want to collapse the navigation pane again, click the button  (*Collapse the navigation pane*) which is shown on the right of the navigation pane then.

2.1.2.2 Modules and Menu Structure

The structure of the modules complies with functional areas like *Accounts payable* or *Production control* and refers to standard roles in the industry. The modules *Organization administration* and *System administration* include basic settings and tasks which are not related to a specific functional area.

The *Common* module contains menu items which not related to a functional role, but which are relevant for all users. These menu items include the *Global address book* (see section 2.4), the *Work items* (workflow management, see section 10.4.3), the *Cases* (see section 10.5.2), and the *Document management* (see section 10.5.1).

Within each module, the menu shows all menu items that you can access. The menu items and folders in the menu comply with the following common structure:

The first folder in the menu is the folder *Workspaces*. It is only shown if the selected module contains one or more workspaces and displays all workspaces that refer to the selected module.

Below the workspaces, there are folders and menu items which provide access to pages for frequent tasks in the particular module (e.g., the vendor management in the *Accounts payable* module).

The folder *Inquiries and reports* contains menu items for analysis and reporting. Inquires show the result directly on the screen whereas reports generate a printout on paper. For reports, you can also select to display a print preview or to save the output to a file instead of a printed hard copy.

The folder *Periodic tasks* contains items, which are not in use every day – for example, the menu items for summary updates or month end closing.

Depending on the module, one or more *Setup* folders provide access to the configuration data of the particular module. Configuration data are entered when initially setting up a company (legal entity). Later on, configuration data are only updated if changes in the business require changes in the setup. Some settings should not be changed without a deep knowledge of the Dynamics 365 functionality. For this reason, the permissions for the *Setup* folders usually are set in a way that regular users cannot edit sensible configuration data.

2.1.2.3 Recent Pages

The folder *Recent* in the navigation pane contains the workspaces and pages which you have visited most recently. Dynamics 365 automatically adds menu items to this folder based on your browsing history. The items in the folder *Recent* provide a fast way to return to a form which you have accessed recently.

2.1.2.4 Navigation Search

The navigation search is a way to access menu items by typing the name or part of the name (similar to the search feature in Windows 10).

If you want to open the navigation search, press the shortcut key *Alt+G* or click the search button  in the navigation bar. In the search field, enter the page title or a part of the navigation path. You can limit the text, which you enter, to the first characters of the words of the page title or the navigation path – for example, the page *All purchase orders* is shown as the first result when you type “al pu” in the navigation search. In the drop-down dialog that pops up automatically, click on the respective menu item or simply press the *Enter* key to access the page.

Figure 2-2: Using the navigation search

2.1.2.5 Favorites and Shared Links

Whereas the structure of the modules and menu items in the navigation pane is given, the personal Dynamics 365 favorites provide an option to collect menu items according to the preferences of the individual user.

If you want to add a workspace or a page to your Dynamics 365 favorites, open the navigation pane and move the mouse to the menu item which you want to add to the favorites. A click on the empty star  which is shown then on the right of the menu item adds it to the favorites. A full star  on the right of the menu item indicates that it is included in the favorites.

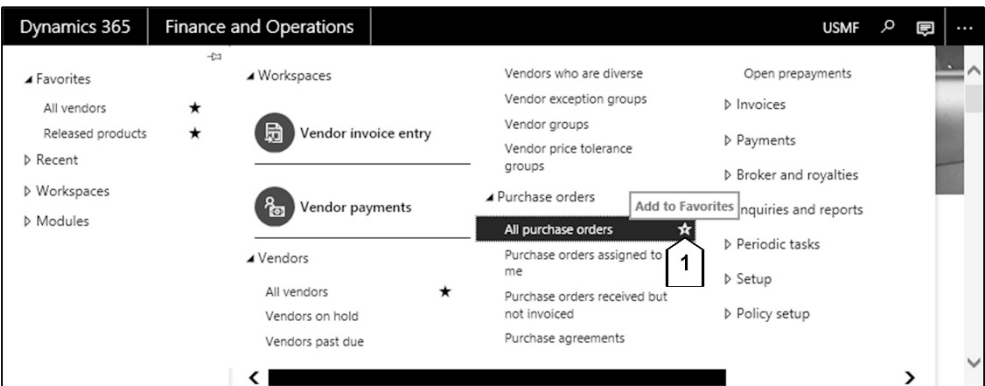

Figure 2-3: Adding a menu item to the Dynamics 365 favorites

Once a menu item included in the favorites, it is shown in the *Favorites* folder at the top of the navigation pane. If you want to remove an item from the favorites, click on the full star  that is shown on the right of the item.

Apart from the favorites within Dynamics 365, you can use shared links to access particular Dynamics 365 forms. In all list pages and forms, there is the button

OPTIONS/Share/Get a link in the action pane. If you click this button, a dialog with the web address of the current form is shown. You can copy this link and send it to other users of Dynamics 365 in your enterprise, or add it to the favorites or the start page of your browser.

2.1.2.6 Switching the Current Company

You can use the company lookup, which you open with a click on the company field in the navigation bar or with the shortcut *Ctrl+Shift+O*, if you want to switch from one legal entity to another. Once you select a company in this lookup, Dynamics 365 immediately switches to this company.

Figure 2-4: Switching the current company

2.1.2.7 New in Dynamics 365

Compared to Dynamics AX 2012, the browser-based interface, which replaces the Windows client, provides completely new options for the navigation. Apart from minor modifications in the menu structure, which eliminate the rigid structure of the *Common* and the *Setup* folder in various modules, core changes include the dashboard (replacing the role center), the workspaces, and the navigation search. There is no address bar within the Dynamics 365 web client, but you can use the address bar of the browser. The favorites do not support a menu structure anymore.

2.1.3 Elements of the User Interface

Microsoft Dynamics 365 contains following types of standard pages:

- **Dashboard**
- **Workspaces**
- **List pages**
- **Detail and transaction forms**
- **Journals, inquiries, and setup forms**

This section explains the elements in these pages.

2.1.3.1 Dashboard

The dashboard, which is the start page in Dynamics 365, includes all your workspaces and is designed to give an overview of your work. The default dashboard contains the following elements (see Figure 2-5):

- **Navigation bar** [1] – Described below.
- **Company banner** [2] – Specified in the company setup (see section 10.1.4).

- **Navigation pane** [3] – Collapsed in Figure 2-5.
- **Calendar** [4] – Determines the session date.
- **Work items** [5] – Refer to the workflow management (see section 10.4.3).
- **Workspaces** [6] – For the different functional areas.

Workspace tiles, for example the tile *Bank management* in Figure 2-5, provide access to the related workspaces. The calendar in the dashboard highlights the *Session date*, which is the default value for the posting date in the current session. The initial value for the session date is the current date, but you can temporarily set it to a different date – click on the respective date in the dashboard calendar or select the date in the menu item *Common> Common> Session date and time*.

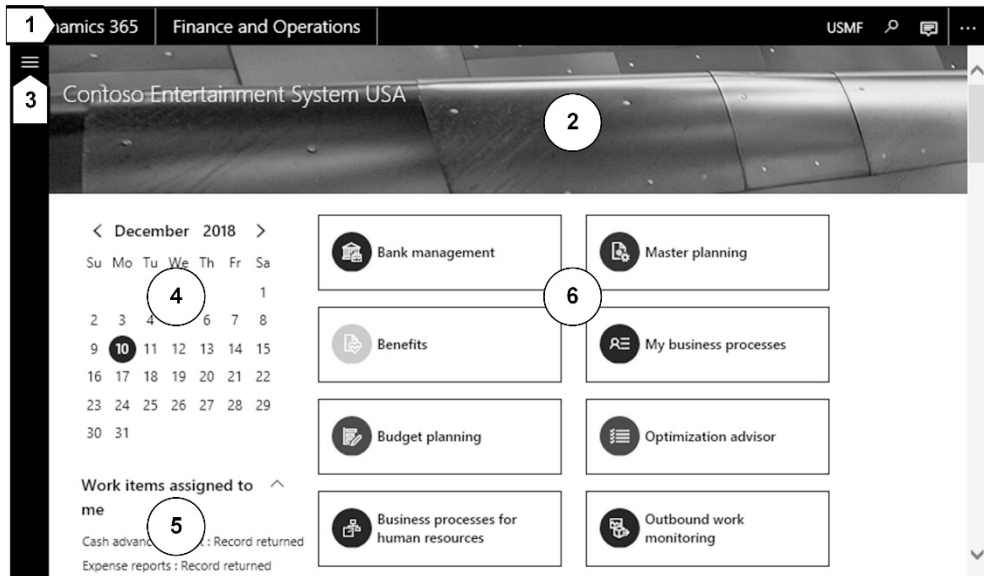

Figure 2-5: The Dynamics 365 dashboard

The button *Finance and Operations* on the left of the navigation bar provides the option to return to the dashboard (initial page) from every workspace or form.

Note: You can select an alternative page (e.g., the employee self-service portal) instead of the dashboard as *Initial page* on the tab *Preferences* in your user options.

2.1.3.2 Navigation Bar

The navigation bar at the top of the Dynamics 365 web client contains the following buttons for global Dynamics 365 features (see Figure 2-6):

- **Dynamics 365 task pane** [1] – Access to Office 365 and Dynamics 365 apps.
- **Finance and Operations** [2] – Return to the initial page (dashboard).
- **Company lookup** [3] – Switch between companies, see section 2.1.2.
- **Navigation search** [4] – See section 2.1.2.
- **Messages** [5] – See section 2.1.4.
- **Feedback** [6] – Feedback to Microsoft.

- **Settings** [7] – User options and other general settings.
- **Help & Support** [8] – See section 2.1.6.
- **User initials** [9] – Sign out.

The options within the button *Settings* [7] include the *User options* (see section 2.3.1), the *Task recorder* (see section 10.5.3), the *Mobile app* management (see section 10.5.4), the *Trace* (capturing a trace for problem diagnosis and performance analysis), and the Dynamics 365 product information (*About*).

Figure 2-6: Navigation bar in Dynamics 365

2.1.3.3 Workspaces

The dashboard, and the folder *Workspaces* in the navigation pane, contain all workspaces for which you have got appropriate permissions.

Workspaces are designed as a starting point for the daily work in a particular job. They are pages which collect all the information and functionality required to perform this job. In the example of the workspace *Purchase order receipt and follow-up* in Figure 2-7, a list of delayed receipts is shown in the center. Tiles on the left and the right of this workspace provide access to connected forms and indicate the related number of records, for example the orders that are not yet invoiced.

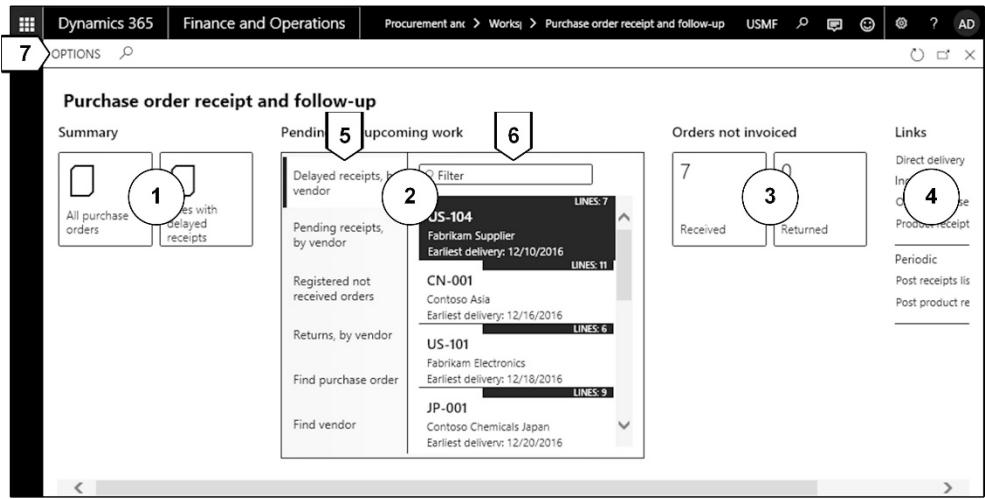

Figure 2-7: Workspace for purchase order receipt and follow-up

In general, a workspace contains the following panes (compare Figure 2-7):

- **Summary pane** [1]
- **Tabbed list pane** [2]
- **Optional further panes** [3]
- **Related links** [4]

The tabbed list pane [2] in the center of a workspace is the main place for the daily work. If you select a list on the left [5] of this pane, the grid on the right [6] displays the related list of records. The filter field above the grid provides the option to enter a filter. A click on a key field (shown as a link) in the grid immediately opens the related detail form. Depending on the particular workspace, buttons in the action pane [7] and, if applicable, in the toolbar above the grid in the tabbed list pane [2] (the example in Figure 2-7 does not include such a toolbar) provide the option to execute actions immediately.

Tiles are rectangular buttons which open pages (in the same way as a menu item button), and optionally display data like counts or key performance indicators. The summary pane [1] on the left contains tiles which provide the option to start new tasks or to access pages which are important in connection with the selected workspace (e.g., purchase orders in Figure 2-7).

Depending on the particular workspace, there are further panes [3] on the right of the tabbed list pane, which contain tiles, charts, or graphs. The rightmost pane [4] in the workspace contains links to further pages related to the selected workspace.

2.1.3.4 List Pages

A list page shows the list of records in a Dynamics 365 table. It is primarily designed for viewing records, but you can activate the edit mode to edit records immediately and you can execute tasks on the selected record with the buttons in the action pane.

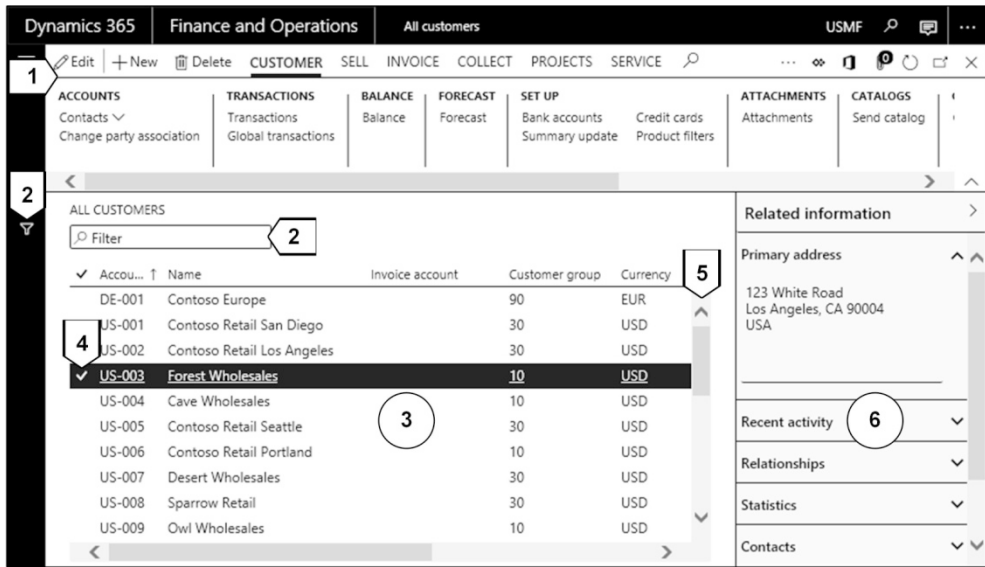

Figure 2-8: Elements of the customer list page (in read mode)

While list pages have got a common structure, the particular elements and features are depending on the respective page. The common structure includes the following basic elements (see Figure 2-8):

- **Action pane** [1] – Contains the action buttons.
- **Filter options** [2] – Include filter button and quick filter field (see section 2.1.5).
- **Grid** [3] – Displays the list of records.
- **Grid checkboxes** [4] – Select one, or multiple, or, with the checkbox in the header line, all records.
- **Scrollbar** [5] – Scroll through records (alternatively press the shortcut keys *PgUp*, *PgDn*, *Ctrl+Home*, and *Ctrl+End*).
- **FactBoxes** [6] – Show additional information on the selected record (e.g., the primary address of the customer) in the *Related information* pane on the right.

If you activate the edit mode with the button *Edit* in the action pane, you can update record data immediately in the list page.

In case the full action pane is displayed, and you need additional space, click the button  (*Collapse*) on the bottom right of the action pane. Once collapsed, the action pane automatically expands whenever you click an action pane tab (e.g., *CUSTOMER* in Figure 2-8). If you want to show the full action pane permanently, click the button  (*Pin open*) on the bottom right of the action pane when expanded.

If the *Related information* pane is collapsed and you want to view the FactBoxes [6], press the shortcut *Ctrl+F2* or click on the collapsed *Related information* pane on the right. If needed, you can collapse the *Related information* pane with the button  at the top of the pane then. As a prerequisite for the use of FactBoxes, the FactBoxes have to be activated in the system administration (*System administration> Setup> Client performance options*).

List pages are not automatically refreshed when there is an update of the data which are shown on the screen (e.g., if somebody else is changing the records displayed in the list). In order to refresh a list page, press the shortcut *Shift+F5* or click the button  (*Refresh*) in the action pane.

2.1.3.5 Action Pane and Action Search

The action pane contains buttons to execute activities on the selected record (e.g., enter a sales order from a customer record) and buttons to access connected detail forms (which display more information). The number and functionality of buttons, which may be shown on multiple tabs (e.g., the action pane tabs *CUSTOMER* or *SELL* in Figure 2-8), is depending on the particular page. If the window size does not allow to show all action pane tabs, the action pane displays the button  on the right which provides access to the hidden tabs.

On the right of the action pane, there are some general buttons:

-  [**Power Apps**] – Insert a PowerApp.
-  [**Open in Microsoft Office**] – See section 2.2.2.
-  [**Attach**] – Document handling/attachment, see section 10.5.1.
-  [**Refresh**] – Refresh the screen.

-  [Open in new window] – Connected windows, described further below.
-  [Close] – Close the page of form within Dynamics 365 client.

As an alternative to the buttons in the action pane, you can use the action search to execute an activity. Click the search button  in the action pane (not in the navigation bar – this would start the navigation search) or press the shortcut key *Alt+Q* for this purpose, and enter the action name or the action pane button path in the search field. Like in the navigation search, you can limit the entered text to the first characters of the words of the name. You can, for example, use of the action search to access the customer balance from the customer list page as follows: First press the shortcut key *Alt+Q*, then type “b” and finally press the *Enter* key.

2.1.3.6 Detail Forms for Master Data

Unlike list pages, which are primarily designed for viewing a list of records, the primary use of detail forms is inserting, modifying and viewing the details of individual records.

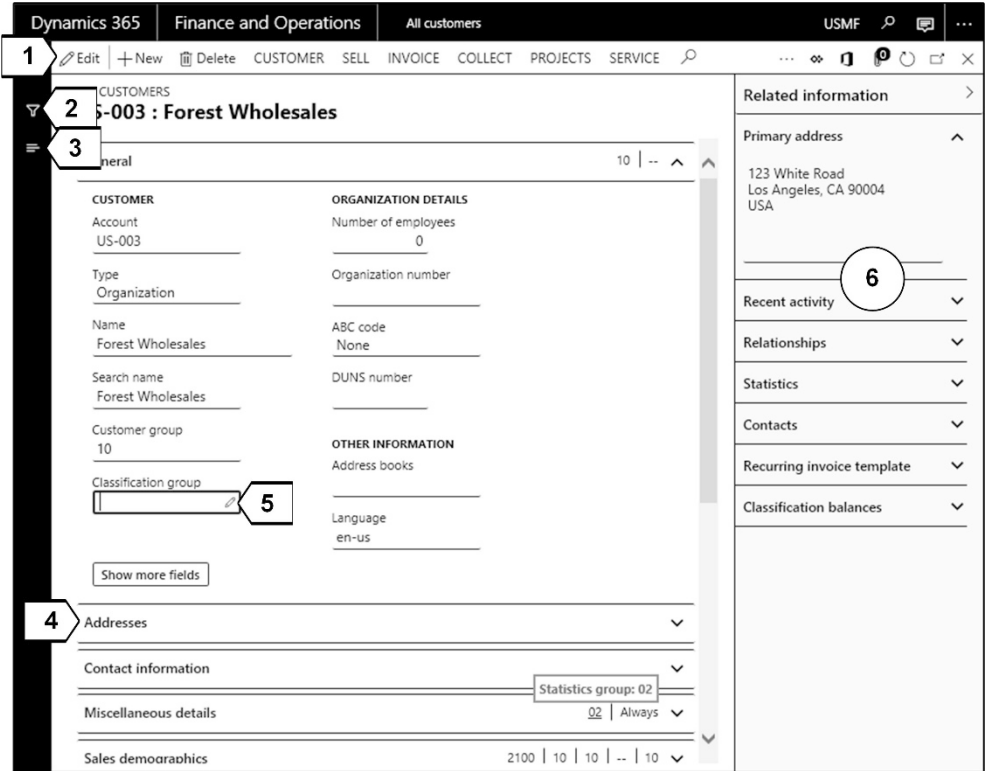

Figure 2-9: Elements of the customer detail form (in read mode)

A click on a key field in the grid of a list page (or the *Enter* key when the field is active) opens the related detail form. Key fields are shown as a link in list pages, usually in the first column of the grid – in the example of Figure 2-8, this is the

column *Account*. The button *OPTIONS/Page options/Change view/Details view* in the action pane of list pages provides an alternative way to access the detail form.

Detail forms have got a similar structure to list pages, and like in list pages, the specific elements and functions are depending on the particular form. The customer detail form (accessed from the list page *Accounts receivable> Customers> All customers*) in Figure 2-9 is an example of the structure of detail forms. The common structure of detail forms includes the following basic elements:

- **Action pane** [1] – Like in list pages (collapsed in Figure 2-9).
- **Filter button** [2] – Opens the filter pane (see section 2.1.5).
- **List button** [3] – Opens the list pane with the list of records.
- **Tabs** [4] – Group fields in line with the functional area.
- **Edit icon** [5] – Enables switching to the edit mode (shown in read mode).
- **FactBoxes** [6] – Show related information (in the same way as in a list page).

You can expand a tab with a click on the particular tab. If you right-click a tab header, the context menu displays options for expanding or collapsing all tabs at the same time. **Summary fields** on a tab [5] show core data directly on the tab. If you want to know the field name of a summary field, hover with the mouse over it. In the example of Figure 2-9, you can view the statistics group “02” in a summary field on the tab *Miscellaneous details*.

With the shortcut key *Ctrl+F8* and the button *Show/Hide list*  [4] on the left in detail forms, you can show the list pane with the list of records. If you select a record in the list pane, the related detail data are shown immediately, and you can use the list pane to move easily from one record to the next. If the list pane is shown in a form and you want to hide, click the button *Show/Hide list*  again.

Section 2.1.4 in this book contains more information on editing records, working with tabs, and other options available in list pages and detail forms.

If you want to return from a detail form to the list page, click the *Back* button of your browser, or press the shortcut *Alt+Back Arrow* or the *Esc* key, or click the button  (*Close*) in the action pane of the detail form.

2.1.3.7 Detail Forms for Transaction Data

Apart from the detail forms for master data described above, there are detail forms for transaction data (e.g., the sales order form in the example of Figure 2-10). Like in the master data pages, a click on a key field (shown as a link) in the grid of a list page for transaction data opens the related detail form. When you access a transaction detail form, it shows the *Lines* view. In the lines view, you can view or edit the (order) lines.

In the **toolbar** [3] of the tab *Lines*, there are buttons for actions on the selected line – for example, the button *Remove* to delete the record in that line. The **action pane** [1] at the top of the form provides the option to execute actions at header level – for example, the button *Delete* to delete a complete order.

If you want to view or to edit details that are not shown in the line grid, expand the tab **Line details** [4]. The tab *Line details* contains multiple sub-tabs which structure the fields of the line.

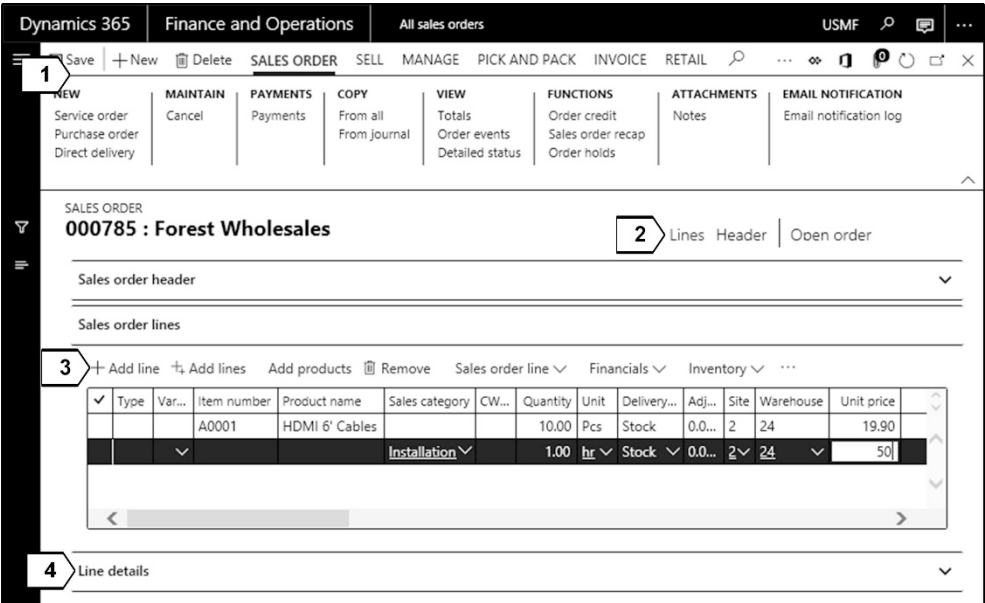

Figure 2-10: Elements in the transaction detail form for sales orders

Some basic header data are shown on the tab *Header* in the lines view. The header view, which you can access with the button **Header** [2] or the shortcut *Ctrl+Shift+H*, shows all fields of the header record. In the header view, the button *Lines* (or the shortcut key *Ctrl+Shift+L*) takes you back to the lines view.

2.1.3.8 Inquiries and Setup Forms

In comparison to detail forms, inquiries and setup forms have got a simple layout. In Dynamics 365, there are following types of simple forms:

- **Simple lists** – Contain all fields in the grid (e.g., *Accounts receivable> Setup> Customer groups*).
- **Detail forms with list pane** – Detail forms, which you can directly access from the menu and which always show the list pane (e.g., *Accounts receivable> Payment setup> Terms of payment*), include the same functionality as the master data detail forms described above.
- **Parameter forms** – Show a table of contents on the left and correlated data on the right (e.g., *Accounts receivable> Setup> Accounts receivable parameters*).

2.1.3.9 Connected Browser Windows

Connected browser windows provide the option to view related information side by side, for example, if you want to view the related vendor transactions when scrolling the vendor records.

In the example of vendor transactions, open the vendor list page (*Accounts payable> Vendors> All vendors*) and click the button *VENDOR/Transactions/Transactions* in the action pane. In the vendor transactions, click the button  (*Open in new window*) in the action pane. The vendor transactions are subsequently shown in a new browser window. The new browser window is dynamically linked to the main browser window, which is showing the previous form (the vendor list page in the example). Moving from one vendor to another in the main window then automatically updates the data shown in the connected transaction window.

2.1.3.10 New in Dynamics 365

Compared to Dynamics AX 2012, the design principles of the browser-based user interface in Dynamics 365 enforce a “flat” design. For this reason, all forms are shown in the main browser window and not in separate windows. All Dynamics 365 web client forms include the action search, and the edit mode is also available in list pages. The list pane in detail forms replaces the AX 2012 grid view. There is no command bar, no preview pane, and no status bar. General options of the AX 2012 command bar are included in the navigation bar now, form-specific features in the tab *OPTIONS* of the action pane. Tiles in workspaces replace the cues in AX 2012 role centers.

2.1.4 Working with Records

In Microsoft Dynamics 365, you can work with the mouse, but you can also use the keyboard for most actions. Apart from shortcut keys, the navigation search and the action search enable fast data input without a mouse.

In the context menu, which you can open from the fields in a detail form or list page, the option *View shortcuts* shows all available shortcuts (open the context menu with the shortcut *Ctrl+F10* or a right-hand click on a field label). In the appendix of this book, you can find an overview of basic shortcut keys in Dynamics 365.

2.1.4.1 Structure of Pages and Forms

When you open a form, no matter whether you access it with a tile or a link in a workspace or with a menu item in the navigation pane, Dynamics 365 shows the related list page.

List pages are the starting point for the work in a particular area. You can search and filter records in a list page, and buttons in the action pane provide the option to edit, delete, and insert data according to your permissions.

List pages only contain a limited number of fields. Detail forms include all available fields of the selected record. If you want to access the detail form from a list page, click on the corresponding key field (shown as a link in the grid).

You can expand a tab in a detail form with a simple click on the tab or – after switching to the particular tab with the *Tab* key – with the *Enter* key. If you want to
