Bruno Siciliano, Università di Napoli Federico II, Napoli, Italy

Sushil Jajodia, George Mason University, Fairfax, VA, USA

Newton Lee, Institute for Education, Research and Scholarships, Los Angeles, CA, USA

SpringerBriefs present concise summaries of cutting-edge research and practical applications across a wide spectrum of fields. Featuring compact volumes of 50 to 125 pages, the series covers a range of content from professional to academic.

Typical topics might include:

- A timely report of state-of-the art analytical techniques
- A bridge between new research results, as published in journal articles, and a contextual literature review
- A snapshot of a hot or emerging topic
- An in-depth case study or clinical example
- A presentation of core concepts that students must understand in order to make independent contributions

Briefs allow authors to present their ideas and readers to absorb them with minimal time investment. Briefs will be published as part of Springer's eBook collection, with millions of users worldwide. In addition, Briefs will be available for individual print and electronic purchase. Briefs are characterized by fast, global electronic dissemination, standard publishing contracts, easy-to-use manuscript preparation and formatting guidelines, and expedited production schedules. We aim for publication 8–12 weeks after acceptance. Both solicited and unsolicited manuscripts are considered for publication in this series.

****Indexing: This series is indexed in Scopus, Ei-Compendex, and zbMATH ****

Preface

Although deep learning models have achieved great progress recently, there still exists a large performance gap between deep learning models and the human cognitive system. Many researchers argue that one of the major reasons accounting for the performance gap is that deep learning models and the human cognitive system process external information in very different ways.

To mimic the performance gap, since 2014, there has been a trend to model various cognitive mechanisms in human brains, e.g., attention and memory, based on deep learning models. This book unifies these new kinds of deep learning models and calls them Deep Cognitive Networks (DCNs), which can implement various cognitive functions, e.g., selective extraction and knowledge reuse, for more effective information processing.

This book first collects existing theories and evidences about cognitive mechanism modeling from cognitive psychology and proposes a general framework of DCNs that jointly models multiple cognitive mechanisms. Then, it analyzes related works of DCNs and focuses primarily, but not exclusively, on the taxonomy of four key cognitive mechanisms (i.e., attention, memory, reasoning, and decision). At last, it summarizes the recent progress and discusses open problems and future trends.

We hope that this book provides a useful reference toward DCNs for researchers, practitioners, and students working on related areas.

Acknowledgments

We express our deep gratitude to Yijun Guo and Qiyue Yin, who have helped us write this book. We would like to thank Lanlan Chang, Jingying Chen, and Sudha Ramachandran at Springer for their kind help and patience during the preparation of this book. We acknowledge the financial support by National Key Research and Development Program of China (2016YFB1001000), Key Research Program of Frontier Sciences CAS (ZDBS-LY-JSC032), and National Natural Science Foundation of China (61525306, 61633021, 61721004, 62236010, and 62276261).
